1. Directional Antennas for handhelds?

Newsgroup: rec.radio.scanner
Date: 1994-01-01 01:33:50 UTC
From: miweber@apollo
Message-ID: <2g2jtu$8ta@sol.ctr.columbia.edu>
Source record: 278158

Does anyone know of a good source for directional antennas usable on my scanners (that have 50-ohm BNC connectors)? I checked out ACE Comm., but they don't seem to have directionals. Neither does Radio Shack (surprise!). I was looking for something that I might be able to toss in the car and drive about to track transmitters in various bands... Suggestions? Blueprints? Schematics?

Sorry if this is an FAQ, but I can't seem to find it. EMAIL appreciated most, to miweber@apollo.davidson.edu. Thanks in advance!

3. Re: Icom IC-R1 - Poor AM Broadcast Reception?

Newsgroup: rec.radio.scanner
Date: 1994-01-01 03:40:58 UTC
From: mjamesb@bnr.ca
Message-ID: <2g2rca$inq@bmerha64.bnr.ca>
Source record: 278159
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Hmmm ... is there any reasonably small portable radio that receives the AM and FM broadcast, international SW broadcast, plus VHF/UHF television bands? The various Sony/Panasonic/etc. worldband radios are very nice but they don't do television bands (or at least the ones I've seen don't).

As long as it's portable (i.e., battery powered), of good quality, and is easy to tune with a decent number of memories, then that's all we'd want. This isn't intended to be an action scanner but a wide-band broadcast receiver. The R1 would be perfect except for this poor (non-existent) AM broadcast reception.

One of the ideas in giving my father the R1 as a present was that if it wasn't good enough, I'd keep it (30 MHz and up is good enough for me). On the other hand, I'd have to say that the fact that it can't even pick up the local AM broadcast stations is enough to make me want my money back.

So, if we were going to try to pick an alternative, what do we look at?

For a directional antenna to produce a good null, the antenna must be tuned to the frequency of interest. Loop antennas have been used for over 50 years for HF, and they might work for VHF. I suspect that they would not be practical at UHF frequencies.

Attempting to use such an antenna, from inside the vehicle, is not likely to give you good results. The antenna will need to be mounted outside the vehicle - preferably over the center of the top of the vehicle.

Direction finding equipment used to be listed in the Radio Amateur's Handbook. I don't know if they are still there, as I do not have a recent copy. The electronics magazines used to publish construction articles on occasion. You might check the Reader's Guide to Periodic Literature, to see what is there. Look under Direction Finding Antennas.

First, good advice to recommend the external mounting of a df antenna.
However, handheld use would probably suggest something smaller. The ARRL
Antenna Book, a separate publication from the ARRL Amateur's Handbook, has
some good explanations and examples of how the df antennas work, and give
several plans on how to build different models. As Bill noted, the null
finding antennas would produce your best directionality, but if you wanted
to listen to the signals as you track them, a Yagi antenna might be a good
solution for you. Although they have a pretty wide directioan pattern to
pick up the signal from the front, and for high precision they get pretty
big (also depedent on wavelength), with a signal strenth meter you can
ususally get a pretty good idea of where the transmitter is. Listening on
a scanner will be pretty hard to do once you get close to the signal,
because to distinguish the direction of the signal, all you have to go on
is the amount of static in the signal, and when you're too clsoe, the
signal will override any local static, and possibly even override the F/B

ratio of the Yagi. Really, to get a comprehensive idea of the different types and application possibilities of DF antennas, you will need to research a bit to find out just what you need. Good Luck

Its problem seems to be antenna mismatching. I attached a ferrite
loopstick and got OK AM reception. But does anyone know how to make a
functional "universal" antenna for it, that works without changing for
different ranges?

7. MODS for PRO-32

Newsgroup: rec.radio.scanner
Date: 1994-01-01 18:12:37 UTC

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've seen a fair amount of talk about several other models, but never anything about the PRO-32 which is what I have. Could someone suggest some MODS for this? Extended frequency range and increased speed of both the scan and search functions come to mind right off.

No, it's more like X.25 packet. Depends on the Vendor, I understand
Motorola's is encoded. If you want to experiment with it, you can buy the
equipment to turn the audio signals back into data at a ham radio store --
but it isn't cheap (about $150).

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Last night, I happened upon a pretty exciting situation while listening in on the big bad city across the Hudson - a robbery turned into a hostage situation in my old neighborhood (Times Square). I caught it from the beginning and it was fascinating listening. However, when the Emergency Services Unit showed up and took over from the local precinct cops, I guess the traffic moved to some tactical freqs and I missed the end of the story.

Does anyone know the freqs used by NYPD in such situations?

BTW, these robbers were pretty darn stupid deciding to pull an armed robbery at 6:45 PM in the Times Square area on New Years Eve! A zillion cops hanging around with not that much to do...

Since I believe both radios tune from 'dc to daylight', I thought it would be appropriate to cross post to each newsgroup.

Anyway, could people PLEASE e-mail me all reviews, comments, personal experiences - anything you can on the above mentioned radios.

I will post a summary if I get enough replies.

Thanks much!

Scott

Message-ID: <2g5l3t$bom@genesis.ait.psu.edu>
Source record: 278168

Hi. Wondering if anyone has any info on modifying the BC855XLT to pick up
cellular freqs.

Also, don't know much about scanners, radios, etc. - I am a novice.
Is this scanner a good one? (Obviously it's not a *great* scanner!)

Is there a scanner out there that I should definitely buy before April
'94 b/c of ease of modification (perhaps also for other features).

Thanks in advance.
- Frank

I don't know what frequencies the ESU units use on scene, but they are
part of the Special Operations Division and are dispatched on SOD Channel 1
which is 470.8375. Other SOD frequencies are (2) 470.6875, (3) 470.6625,
(4) 470.8625.

On my R1 I have been using a Radio Shack telescoping antenna (part number 20-006). Claims range of 25-1296 MHz, but also really improves the AM reception. With the regular R1 antenna, I also can't get any AM stations (40 mi from NYC). With the radio shack, I can get quite a few AM stations and lots more shortwave stations (all the biggies). In my case, this antenna also improves regular VHF/UHF frequencies dramatically. So it seems to me the standard R1 antenna is pretty poor...

>(4) 470.8625.

Howdy neighbor - I'm writing this from a few blocks from Stevens...

Hmm... my Police Call book shows

470.8375 as Highway
470.6875 as Citwide 2 (which I was monitoring)
470.6625 as SOD (which I was monitoring)
470.8625 as SOD (which I was monitoring)

Maybe that first frequency is the missing link.

By the way, I have noticed that while Hoboken's PD has a load of freqs
assigned according to Police Call, they only seem to use 866.6500 (seems
like the primary) and 868.2750 (seems like a seldom used secondary).
Is this is the case?

Thanks

24. Packet Radio?

Newsgroup: rec.radio.scanner
Date: 1994-01-02 22:48:47 UTC
From: wilson@sluatm.slu.edu
Message-ID: <9401022248.AA01156@sluatm.slu.edu>
Source record: 278079

Can someone please tell me what "packet mail" or "packet radio" is?
I've seen references to one of them (I don't know which one) in this
newsgroup but I'm unaware of what it is.
Thanks

Mike

26. PRO 43 MODS FOR CB

Newsgroup: rec.radio.scanner
Date: 1994-01-02 23:47:47 UTC
From: arcmu@ee470.ee.mcgill.ca
Message-ID: <CJ10ro.6xt@sifon.cc.mcgill.ca>
Source record: 278100

Hi folks,

I'm kind of new in the business. I got myself a PRO 43. I'd like
to know where I can find the MODS for the Cellular Band (anywhere on
Internet ftp sites etc...). Also I am looking for frequencies in the
area of Montreal, Canada (any frequencies will do, just to get started).

Thanx.
.

27. need mod for pro2024

Newsgroup: rec.radio.scanner
Date: 1994-01-03 02:27:32 UTC
From: camter28@astro.ocis.temple.edu
Message-ID: <1994Jan3.022732.19271@cronkite.ocis.temple.edu>
Source record: 278084

I hate seeing these posts, but I have a pro2024 and can't find
a single mod for the thing. There must be something I can do
to it, other than hit it with a sledge, does anyone have any info?

I have searched all the mod sites..... and nothing..

Thanks in advance.

28. *WANTED* frequency list for sf bay area

Newsgroup: rec.radio.scanner
Date: 1994-01-03 02:29:02 UTC
From: caliban@soda.berkeley.edu
Message-ID: <caliban.757564142@soda>
Source record: 278083

i just purchased my first scanner and now i am
going to set out to program it. i live in san
francisco, and would like a list of frequencies
used by local agencies. fire, rescue, police
and ambulance are of particluar interest, but
hopefully another sf area scanner fan can turn
me on to other interesting frequencies.

thank you in advance!

29. Regency D300 Question

Newsgroup: rec.radio.scanner
Date: 1994-01-03 05:38:34 UTC
From: cll4@Isis.MsState.Edu
Message-ID: <2g8b0q$c9@Tut.MsState.Edu>
Source record: 278085

I have a Regency D300 that I am wanting to sell. It is a 30 channel with delay, 2 scan speeds, search, and 1 priority channel. It covers 30-50 MHz, 144-174 MHz, and 440-512 MHz.

What is a reasonble price to ask for it? I am thinking of asking $145 or so. Does this sound okay?

Any comments are welcomed.

Thanks,
Craig

Only several hundred pages' worth. Go to a tech-oriented bookstore or ham radio equipment dealer and pick up Volume 1 and 2 of the _Scanner Modification Handbook_ by Bill Cheek.

You'll find some simple stuff like the restore cellular coverage, speed up scan, and the 400-channel mod at ftp sites, but if you really want to get into this beast, pick up these books. You have NO idea what you're missing...

31. InterTAN NET SET PRO-2029

Newsgroup: rec.radio.scanner
Date: 1994-01-03 09:14:49 UTC
From: corwin@peche1.ensta.fr
Message-ID: <2g8nm9$s2j@homea.ensta.fr>
Source record: 278086

Hello, world!

I have this NETSET PRO-2029 scanner that I got for Xmas... And was wondering
if I could hack into it...

I opened the box and found the main chip to be labeled: GRE-0811, followed by:
342 2947XX. No manufacturer, nothing more.

Does anyone know who makes this chip? Where I could get some info on it?

This scaner is manufactured by InterTAN (Texas?). Anyone know their phone
number?

Thanks for any help!

Gilles.

35. Cordless Phone Monitoring

Newsgroup: rec.radio.scanner
Date: 1994-01-03 15:25:29 UTC
From: mjohnsto@ditdah.Morse.Net
Message-ID: <1994Jan3.152529.2874@ditdah.Morse.Net>
Source record: 278091

[Please do *NOT* respond directly to this posting. Email to
jkearman@arrl.org. I'm posting this for him.]

The American Radio Relay League (ARRL) is currently unable
to read news directly. Thanks to a friend of mine, I can read
scanner and shortwave news, but there's a time shift between
when news is posted and when I can read it.

This posting is Copyright 1994, ARRL. All rights reserved.

Sometime in the middle of December, someone on this group
mentioned asking ARRL about the legality of listening to
cordless phones. The poster said someone here told him it was
legal.

First, let me state that our opinion on legal matters should
be taken at face value. We neither make nor enforce laws. We
don't even have an attorney on the premises.

That said, whomever this person talked to was apparently
referring to federal law. As it stands now, cordless phone
conversations aren't protected by the Electronic Communications
Privacy Act (ECPA). **** Some states, however, have passed laws
making it illegal to listen to cordless phone conversations
without a wiretap warrant. ****

I have been unable to find the Headquarters staffer to whom
this person spoke. I spoke to our Regulatory Information person,
John Hennessee, this morning. John is the person the caller
should have talked to, but he claims no knowledge of the call.
John deals with FCC issues mainly, and said that would have been
the basis of his answer. John didn't know about states' laws on the
subject. As we are an Amateur Radio organization, he certainly can
be forgiven for not knowing.

Good listening.

Jim Kearman, KR1S
Assistant Technical Editor, ARRL

---

Below is a collection of SW receiver reviews written by readers of Rec.radio.shortwave. The number following the brand and model number is the number of readers, who indicated they use this type of receiver.

All credit for these reviews should be given to the readers of this group and not me.

John Lloyd

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 - 1

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power

supply included.

An outstanding performer, and worth the price to a serious SWL
or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the
GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The
Sony is slightly smaller and has a somewhat more "finished" feel
about it. The Grundig is SOLID with a much better sound. Neither
is as good a SW signal receiver as the previous Sony, the '2010
(2001). However, they both have very advanced features;
multiple (and in the Grundigs case, expandable) memories with
alphanumeric tags so that you have a name as well as a frequency,
all sorts of memory grouping and scanning etc. The Grundig has
good RDS ident. on it's FM band, but I have a feeling that this
isn't used much, if at all, in the US. If you intend to buy
second-hand, be very wary of the SW77 - the early version was
pretty flakey. The later version is better but still not as good
as the '2010.
I think that the choice comes down to "feel". They are both quite
complex to use, but both work as advertised. Try 'em both as they
have quite distinct operational methods. If sheer performance on
SW is the main point for you, compare them with the Sony ICF2010.
You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the
Grundig. I have my Satellit 700 in daily use and it's performed
without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to
the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in
the set, which is how I have it set up. (The SW77 used C cells)
They both run down batteries fast. The Sony worse than the
Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer
heft of the Satellit. A Satellit with a full load of 4AH Nicads
can tip the scales at twice the weight of a SW77. Of course, if
drop one on your foot the Sony would be the better bet ! I
only use the Grudig about the house. I have a '2010 for the
road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following

message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700.
The sound from the radio is truely impressive! I have always
wondered why broadcasters put music on shortwave, because it
alway sounded like garbage. However with the 700 I can listen and
enjoy the music. The 700 has Bass and Treble controls, which
improve the sound quality but the Automatic Gain Control most
likely does the most toward improving the sound (I'm not an
expert, so this is just a guess!). Anyway my Wife
regularly listens to music coming from a 60m band radio station
in Guatemala, and can enjoy the sound. However there are some
bad points. It is programable, but I have not worked out how to
do it yet. Well I tried once and gave up. This is not too
bad though, because BBC, Deutche Welle, and about 10 others
are stored in a ROM table. And these frequences actual work
(i.e. they are the frequencies for North America and NOT
Germany).
Also I connected a long wire antenna and found my local AM
station on shortwave. I guess the front-end is not good enough to
sort the signals out when coming from a large antenna. But don't
worry about this either.
If you only want to listen to the biggies like BBC, Deutche
Welle, you won't need an external antenna. I am planning to put
a Pre-selector between The Radio and the Antenna, and I think
this will cure the problem of AM stations on shortwave and cut
out some interference. Finally I recommend this radio to you. I'm
sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is
still an excellent piece of equipment. Excellent sensitivity and
selectivity. Digital display with two separate clocks (only
one displayed at a time), signal strength meter, frequency
readout, and four-character user-definable "name" for each
memorized station. 42 memory positions. Tunes to .1 kHz
increments. Selectable wide/narrow bandwidth for AM mode
reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry.
In addition to AM, has three receiving "modes" for LW, MW, and
SW: USB, LSB, and "Sync," which should more accurately be
described as "fine tuning," as this implementation of synchronous
detection operates differently from the Satellit 700 or Sony
2010. Selectable automatic/manual gain control. Covers LW
(150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM
(87.5-108 MHz).
Excellent audio output, with separate treble and bass controls.
Stereo through headphones. Line-level out (mono), external
antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued,
many outlets are selling this unit at close-out prices, making
this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it.
I miss the 512 memories of 700 and 'SSB clarify' control
sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However,
it is rather simple to make it work similarly to '700 and '2010,
because the detector chip is the same in all three. Only a switch
with two pairs of contacts is needed. Another design fault, the
excessive distortion in SSB mode, can be partly cured by adding
two resistors. For serious DX-ers it may be important that the
internal ferrite rod cannot be disabled on MW and LW in both 500
and 700, so the in-house noise may become a problem on these
bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise.
Similar number of cubic inches as the Sony (different shape), but
offering some features of the R8. Also the Lowe is made with a
mostly solid alumnum case, which is better than the Sony or the
Drake. The Lowe has dual antenna inputs (wire or SO-239), record
out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes
8 internal AA nicads *OR* disposable batteries. It will recharge
the nicads with a builtin recharger if you plug it into
an external power supply. It's a nice semi-portable radio. It
has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with
it. I use it mainly for broadcast listening. It's connected to
25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial
and the coax, and on some frequencies it gave a (small)
improvement in signal strength, but it was such a pain to keep
retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to
offer the best of both worlds - improved matching between the
wire and the coax, but no retuning necessary. It's rather
expensive, though, and it may be that I'd have been just as well
off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of
tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments. No tuning knob but the slew tuning buttons work just fine. It's about the size of a paperback book and can be taken anywhere reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband filter work as one would want. The AM 455Khz ceramic filter is junk,

and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S iaN amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the first one I had,but not as much on the seconone.The first 525 I had would "click" on strong AM signals,but the new one doesn't.The main tuning knob spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!) All in all, a great reciever.

Japan Radio Company NRD-535D - 1

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE keys on the keypad. That should not happen on a $300.00 radio!

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

Macintosh Amateur Radio Software - January 1994
Version 1.05

First of all... Happy New Year to all of you Mac Hams. Hope Santa was good to you and you have a neat new toy or two!

Please feel free to distribute this list as widely as possible. Many of you have asked if it is OK to cross-post this list? I don't mind, but I would like to know where it is going. If you think it should be cross-posted to other USENET groups, please let me know so I can try and manage these. We don't want to have any duplication or our welcome will be wore out!

Those of you that can tell me about ANY of these programs compatibility with System 7 would be appreciated! I am going to be adding a System 7 compatability section to EACH description in future releases. If the application is KNOWN to execute properly under System 7, the System 7 anotation will be placed as the last line of the product description. More clarification on levels of System 7 compatibility in the future editions... but this is a start!

Some of the information in this list was gleaned from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: I've started adding more version numbers so that our users will know if they have the most current release. Thanks to those that have already sent them in... I'll accept all corrections!

This list contains info on updated for several applications: updated information on Kantronic's Host Master(thanks John-WD1V) and Lar's newest release of Morse Trainer 1.1.1. Ivo-ON1XK and Adam-PA2AGA both contnue to be busy with new releases of IM/Mac and NET/Mac repsectively. I know that Adam made changes to support the multiport serial boards... and now we can have up to 16 TNCs connected! Thanks Adam, Ivo and Lars for some great products!

MacSPOC is the most recent new entry

I have been informed that The World, world.std.com, is the newest site carrying the Mac Ham Radio Software. Scott-WY1Z is maintaining these file as the Librarian of the Boston Amateur Radio Club. Look in the following path: /pub/hamradio/mac. Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software. The ARRL ListServer is also carrying the latest

version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs.
ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4 If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Carlson, 3 Spruce Street, Hudson, NH 03051. Diana will no longer

send out the stacks unless the envelope has sufficient postage
for return mail (in general, that means .52-.98, depending on size
of envelope) and for those who send a standard business envelope,
she takes no responsibility for the condition of the diskette
through US mail. Available via anonymous FTP from various sites,
including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest
releases of Novice and Technician stacks are available at
uxc.cso.uiuc.edu (5/6/93) Author is available via Internet:
dls@genrad.com
System 7 savy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General,
Advanced, and Extra class written elements. Includes the complete
question pool for each license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or
punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also
available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation
characters. Available via anonymous FTP from ftp.apple.com
(/pub/ham-radio). Or send formatted 800K Macintosh disk with
stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB,
726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to
improve their speed. Allows code practice at various speeds and
audio pitches. Can generate random sequences or play the contents
of user-created text files. Freeware. Available via anonymous
FTP from whirlwind.stanford.edu (/pub). Contact Edward Plumer,
KM6IQ, for more information; Internet: plumer@isl.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice
files. David A. Kall, 700 Marine Parkway #314, New Port Richey,
FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your
receiving speed. It has several ways that it can send letters and
punctuation. Shareware. Doug Havenhill, Dynamics and Control,
7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training

programs is that this one will not continue sending until you
provide the correct answer. Major changes which have been suggested
and implemented since last version include: after three incorrect
responses the program shows the correct character; the list of
characters at the end which will show those you know and those
you need more practice on; the frequency of the tone has been
changed; volume of the tone has been reduced; the character " - "
has been added (dah dit dit dit dah) Comments can be sent as
follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet
radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD
21719

*** Packet and other digital modes ***
<NET/Mac 2.3.34>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC
with KISS mode. Copyright, but free for noncommercial use. The latest
releases have added support of multi-port serial boards like AE's QuadraLink.
It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the
modifications to NET/Mac. This version (and others) is available via
anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming),
mac.archive.umich.edu and
System 7

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file that
PC owners use with NOS. Created by Ken-NS1C is available on many TCP/IP
packet switches in New England.program.
System 7

<IM/Mac 1.0b27w>
Mailer program for use with the SMTP protocol. Alternative to the BM program
that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly
updating his mailer program. His newest release supports built-in BinHex
support, selectable sound chimes for incoming mail, "quoting" of forwarded
messages and lots more. If you are not using this program... why not? Check
for the latest release in the directory before "blind" ftp'ing. This
software supports System 7's Ballon Help and is System 7 savy! Available via
anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming).
Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo
System 7 savy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use with
packet-radio modems such as the Baycom kit and PacketMac Modem. Version 1.8
July 9 1993 update since 1.6. KD6PAG found a bug in quoting recieved escape
and end characters is sofktiss 1.6. The bug and the fix and patch are all
correct, thanks for some great detective work. Lots of doc files and drawings
included in this archive! Requires the Serial Tool from Apple's
Communications Toolbox! Available on the HAMNET forum of Compuserve, America
Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).

System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O. Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.1>
A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC,
unlike MacRatt or HostMaster.
A demo version of the product is available at cpre1.ee.iastate.edu (pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA
98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX.
Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, multiple connects; supports KPC-2, KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.05>
PacketTracker ver 1.05 is a program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he

cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox.
System 7

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging ***
<Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 3.5>
Allows real-time or post-contest logging of a wide variety of contests. Checks for dupes, figures scores instantly, and offers various printouts. Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to Kenwood transceivers, and to MacinTalk for easy post-contest entry. Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters

contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!) N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

*** Propagation, gray line, DX headings ***
<DX Map v1.1>
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0. Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas

of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St.

Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<Macintosh Spacecraft Personal Orbit Computations (MacSPOC)>
Software used aboard the Space Shuttle and in Mission Control to track the Shuttle. Models engine burns, orbit perturbations, and the Shuttle's orientation. Free online data uploads during Shuttle missions.
Commercial v1.5 available from Daniel R. Adamo, 4203 Moonlight Shadow Ct., Houston, TX 77059; telephone 713-480-9631; AppleLink: D3176; America Online: AdamoD. Test drive v1.1 available on AppleLink (path "K-12 Education: Education Resources: Science Resources: MacSPOC: Space Shuttle Orbit Software"). Author is on AOL and can be reached as adamod@aol.com via the internet.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are

provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<MacScience BBS>
Various ham-related applications, including antenna design, propagation, WEFAX, packet, and Morse code. (408) 866-4933.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

*** Online Services carrying Ham Radio software ***
<America Online>
Supports Macintosh, PC's DOS & Windows versions, PS/1, Apple //s, Casio Zoomer. Ham Radio Club (keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364 Ext. 6285. This site NOT ftb'able (yet). Internet e-mail.

<CompuServe>
Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats.
Call 1-800-848-8199 for information. This site NOT ftb'able. Internet e-mail.

<Delphi>
(more info at a later date) Internet e-mail

<GEnie>
(more info at a later date) Internet e-mail

<Prodigy>
Has ham radio message areas, no downloadable software. Limited internet e-mail.

Source record: 278096

Hi,

My apologies if this has been covered before:
Radio Shack sells a frequency counter for around $100. Does anyone know exactly which bands it will hit? Is it really 0-1.3GHz or so as one sales droid claimed? Does it register in the 800 MHz cellular band, or are there built-in censoring mechanisms to preclude that? Are there any known mods for it?

Any info would be greatly appreciated.

Thanks in advance,
-Patrick Penzias Dirks.

41. HELP! Sick BC100XLT

Newsgroup: rec.radio.scanner
Date: 1994-01-03 19:55:34 UTC
From: rolson@faatcrl.faa.gov
Message-ID: <2g9t7mINNehd@faatcrl.faa.gov>
Source record: 278094

I read a few months ago about some problems with BC100XLT's
battery (I think). I have a 5+ year old scanner, with the
original battery pack.

Symptom #1 : After fully discharging (as much as I could, display
was blank, reception poor) battery, I plugged in the AC adaptor
overnight. Next morning, LO BATT still flashes. BTW: This unit
has seen a lot of use (and recharging!) Is the battery pack history?

Symptom #2 : Up until a few months ago, all keyboard functions worked.
Now, pressing 'SEARCH' causes "Error" to be displayed on the screen!!
Might this be related to Symptom #1? or do I have bigger problems?

Last question: Is it worth it to try and 'build' my own replacement
battery pack from some off the shelf nicads, wired together like the current pack, or just
try and order a new pack (From Uniden??)

Thanks in advance
Rick Olson

Denver/Eastern Front Range/North Central CO Edition 9308 SCANlist 9311
COPYRIGHT (C) 1993 The Metro Comm Center/Phil Mangone. All rights reserved.
Updated 11/01/93 for Denver and the Eastern Front Range.

Some Information provided by the Denver Metro Scanner Guide COPYRIGHT 1991-1993
with permission of the Author.

Distribution of this list is at no charge and courtesy of this BBS from the
The Metro Comm Center. Use of this on-line publication for monetary gain or
republication without permission of the Author(s) in part or whole is
prohibited.

Updates to this list and other frequency lists are available for download from
The King's Market BBS @ 665-6091, Electronic Library @ 935-6323, Hefty's
Mountain Village @ 427-8002 and The Fire Board @ 657-0273.

Use of this information in the commission of a crime is prohibited and
prosecutable by Local, State & Federal Laws. I do not assume responsibility for
misuse of this information.

Due to the nature of Public Safety Communications frequencies and use are
constantly changing therefore I do not assume responsibility for changes,
incorrect information and omissions. Use of this list is to enhance one's
use of a scanner or similar type receiver.

At the time of release of this file there are no known mobile scanning laws
within the state of Colorado. However due to 'home rule' jurisdiction allowed
by the state it would be wise to check on local regulation in your area.

I do not encourage anyone to "Chase" calls as you are asking for trouble with
law enforcement officials and they will not hesitate to prosecute.

KEY INDEXES AND DEFINITIONS

F-# Short for channel . i.e F-1 is the same as channel 1.
###.#### S Indicates non-repeater use. Both base and mobile stations
use the same Frequency Commonly referred to as "Simplex"
PD Police Department

FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Control etc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems for
"Input Scanning"
IFB Interruptable Feed Back. TV audio feed for reporters.

Notes for November:

THORNTON FIRE

Thornton Fire is now dispatched on 460.550 AdCom Fire F-2. Fireground operations are now conducted on 460.600.

AURORA

Latest word is Aurora making the switch to 800 MHz during the 1st Quarter of 1994. All their Police vehicles now have the elevated feed 800 antennas which will be used for the new radios.

WELD COUNTY

The City of Greeley took over the Weld County Communications Center in Mid October. There has been no change in the PD/FD channel usage assignments so far. Testing of MDT's to incorporate the City police CAD/MDT system for use by the Sheriff's Department is underway. Sheriff's Department officers have made some very negative over the air comments about the MDT's so far. Due to the terrain within the county the data communications are on 800 MHz and there are null areas all over the place. I predict that the costs involved to encompass the county will be too high and the idea will be dropped.

-*>100 channels less. How else is the Pro 46 disadvantaged? Not as
-*>sensitive perhaps?
What is the exchange rate right now. I might be advantageous for
those in the US to go up to Canada to buy a Pro-43.
Definately buy the 43. 46 is double conversion, 43 is triple
conversion + Military Air band.

In article <2g9t7mINNehd@faatcrl.faa.gov>, rolson@faatcrl.faa.gov (Rich Olson) says:

> I read a few months ago about some problems with BC100XLT's
>battery (I think). I have a 5+ year old scanner, with the
>original battery pack.

>Symptom #1 : After fully discharging (as much as I could, display
>was blank, reception poor) battery, I plugged in the AC adaptor
>overnight. Next morning, LO BATT still flashes. BTW: This unit
>has seen a lot of use (and recharging!) Is the battery pack history?

Certainly a strong possibility. There are only so many charges in there..

>Symptom #2 : Up until a few months ago, all keyboard functions worked.
>Now, pressing 'SEARCH' causes "Error" to be displayed on the screen!!
>Might this be related to Symptom #1? or do I have bigger problems?

If you can replace the batteries at a minimal cost and this
problem goes away -- or doesn't -- then we'll know. It sounds
like a separate matter, but cross your fingers...

>Last question: Is it worth it to try and 'build' my own replacement
>battery pack from some off the shelf nicads, wired together like the current
>pack, or just try and order a new pack (From Uniden??)

I can speak only of my own experience. I have a BC70XLT and had
similar "BATT" message problems. I bought replacement Ni-Cads
at Radio Shack for a fraction of the cost of the replacement
battery pack. I had to remove the wiring and solder it on the
new pack, but that was it, and it has worked fine for me for
a couple of months. Your mileage may vary! Stay tuned for
any discenting comments on the net!

52. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-01-04 08:12:18 UTC
From: bill@thd.tv.tek.com
Message-ID: <1994Jan4.081218.17154@tvnews.tv.tek.com>
Source record: 278105
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 03-Nov-93]

This is a list of FCC license data sources available to scanner listeners. Please e-mail corrections and additions to me.

POLICE CALL

This is probably the most cost-effective source for public service license information. The detail is limited, but the information that is there is often more useful form than the raw FCC data. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the FCC master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

MICROFICHE

Lee Reynolds (lee@tosspot.sv.com) has made available copies of the entire US database on microfiche for $75 a copy. There are three sets in all - by callsign, geographic area, and frequency - for a total of about 200 fiche. His current set is from the beginning of 1993. E-mail Lee for more information.

The Bearcat Radio Club sells microfiche by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. The following data fields are provided: frequency, call sign, licensee name, service code, city, county, state, latitude, longitude. Grove Enterprises can be reached at 800-438-8155.

PERCON

PerCon sells FCC data on CD-ROM by state or by category for $100 per CD. The categories are divided as follows: public service & land mobile, common carrier, industrial, etc. The data is complete, i.e., it contains all of the data in the FCC master database for the state or category covered.

PerCon is now developing a CD-ROM of the entire US FCC database (approximately 3 million records). It will not contain all of the data fields, however, because disc space is limited. I asked about using data compression, but PerCon says that their customers want the data in dBase format (i.e., uncompressed) to use with their own software.

I will post more information about this product when it is available. PerCon can be reached at 716-386-6015.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

I recently sent for this data and found it impressive. The 30-mile radius around Portland, OR (which CET does not consider a major city) contains nearly 10,000 records.

The data is more detailed than Grove's and isn't much more expensive if you need more than one state. CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude for the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. In my case, the server returned the coordinates of the main post office.

If you are interested in purchasing this data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. You do this at your own risk, however. CET can be reached at 800-445-0297.

The CET data records contain the following fields: transmitter frequency; service code; type code; transmitter latitude and longitude; call sign; transmitter output power; effective radiated power (ERP); antenna height from tip to ground; site elevation above sea level; number of vehicle, portable, aircraft, marine, and pager mobiles; transmitter city, county, and state; current expiration date; licensee name, mailing address, city, state, and zip code.

From: jlogan@netcom.com
Message-ID: <jloganCJ40ro.56A@netcom.com>
Source record: 278108

I've just gotten the "bug" to get a scanner. I would thought that I'd
check with some experts before I go out and buy the wrong scanner.
Here is what I would like to do, (and cheaply, I'm a student.)

Monitor Police, Government freq's
Cellular, portable phones
Be able to connect to my PC in order to receive pictures from AP
Be able to receive and decode Morse on my PC, receive APnews wire
I'd like to be able to do traffic analysis with it and my PC controlling it

Is there a good place to buy used equipment? I've bought the current
copies of Monitoring times, and Popular Communications and I've seen
some things that look really slick to do with a scanner. I know that
I've got to buy an adapter for the PC interface, but prices were
about $100. In regards to the scanner, am I getting things mixed
up? Do I need a "base" shortware radio and not a scanner?

jlogan@netcom.com

54. Introduction to Scanning

Newsgroup: rec.radio.scanner
Date: 1994-01-04 14:42:59 UTC

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves by their sensitive baby monitor intercom. Yes, it's legal to listen, and it's all there in the 46 and 49 MHz ranges.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Scanners are available in two varieties: crystal controlled and programmable. The crystal controlled models are cheaper, but require the user purchase and install a $5 crystal for each frequency of interest. Programmable (synthesized) units are replacing crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crys-

tal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system.

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more

sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended

search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency

information from other states, and plenty of good product
reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

[last updated August 10, 1993]

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 1: Books, Magazines, Government Records, and Clubs

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25.1 This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for

---

1. Grove Enterprises, PO Box 98, 140 Dog Branch Road, Brasstown, NC 28902. tel (704)837-9200

several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.2

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide.3 The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.4

3. Official Scanner Guide, PO Box 712, Londonderry, NH 03053.

4. Scan America, 430 Garner Drive, Suffield, OH 44260-1557

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)5. Only 12 of the 21

information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau",

indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'6.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

In 20 years of being an amateur radio operator, and belonging to amateur radio clubs, I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges,

---

5. See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.

6. See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.

there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

- 6 -

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall7, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

---

7. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

- 7 -

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

- 8 -

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much

like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a

county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm
Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them!8

---

8. One may use FCC license microfiche, described in Part I of this article, to identify stations using call

Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center9
Lisle, Illinois

I watched the driver pick up a microphone, and listened
to him on my portable scanner checking back with his

---

letters.

9. XYZ is a pseudonym for the actual licensee name.

"base".

All the pieces fit: the "guests", the "classes", the
"instructors". Mystery solved; I had been monitoring the
customer training center for a large computer manufac-
turer. The training center has hotel rooms and dining
facilities to accommodate students from out of state. As
a convenience, shuttle van service is provided to local
shopping malls.

Summary

Through books, government records, and radio clubs,
scanner listeners can make use of frequency information
compiled by others. Two-way radio users often fail to
identify their transmissions properly, making it more
difficult for listeners to know who they are monitoring.
By examining radio equipment labeling, and monitoring and
taping transmissions, scanner enthusiasts can unearth new
information.

How to add a hold function to the Radio Shack RF Frequency Counter:

Ground TP 17. In the schematic, TP17 is pin one of U3, connected to +5V thru a 47k resistor. On the circuit board, TP17 is on the display side, just right of the lower-right corner of the IC. Grounds are about 1/4 inch below and to the right, the three non-tinned points in the large area of metal. TP17 is the tinned pad next to a SM resistor marked '473' for 47k.

I rigged a momentary switch to ground TP17 thru a 1k resistor (you never can tell) and it works just fine! I drilled a small hole to mount the switch just above the plastic depression so I could push the button with my right thumb. A small toggle switch would fit if you want to hold longer.

Galen, KF0YJ

spread-spectrum, frequency hopping

--
Hi,

I'm working on the protection of traffic-data in radio-networks.
Traffic data means: who, when, how often and how long is anybody
communicating with anyone else. One problem is to prevemt the
finding of a transmitter's direction and location. At the moment I
consider using spread-spectrum systems and frequency hopping.
Are there any ideas to do so or can anyone help me finding other
ways or any literature to solve my problem ??

Thanks

The main factors are 1. The height of your antenna and the transmitting antenna. 2. The terrain (i.e. flat, mountains, forest, desert). 3. the output power of the transmitter. 4. lots of little things...

Technicalities aside, with the provided wip antenna, you could probably expect between 5 to 30 miles of range. An omni type roof antenna might get you to 50 or 60 miles in flat terrain. These numbers are just guesses so no flames please, there are many factors that can affect this, including what frequency range is being monitored. Hope this helps a little.

I had exactly the same problem with my 200XLT. It wouldn't search anymore, it gave the error message you described. I wondered if it was hosed and put it away for at least 4 months or more. It had chronic "Low Batt" indications too, I knew the NiCds were nearly dead.

Just for yuks, I pulled it out and recharged it after all that time. No channel memory loss, and works fine (but still gives an early low batt indication, I think there is a mod for that plus the cells are still weak). I guess the discharge period was just right. I've got new NiCds ready to put in, I just need to find an alternate power source so the channel memory sticks around while I'm doing the repair. Or, is there a lithium backup battery for the memory so I don't need to worry???

Your 5 year use is fairly remarkable. Just change 'em, and a tip: it seems that good quality AA-size NiCd cells used for radio control car/truck/boat/etc. applications are very good! I have some that are fairly heavy in weight, with no markings; one has been going in my pager for 2 weeks with 8-10 hours of standby use a day. I charged it with a $10 tray charger I bought years ago. The heavier the cells are, the more Heavy Metal inside... don't buy those wimpy cells that weigh very little. Mine are plain white, so I don't know what kind they are. I got 'em from a friend who owns a hobby shop (who's got a 100XL himself).

I have a chance of getting ahold of the following used equipment at going-out-of-business-sale prices.

First of all, I would like to know what these things are.
Secondly, something here sounds interesting to you, let me know and I will point you to it.

Here is the list:

DESCRIPTION QUANTITY
=========== ========

Yeasu FTC-2640 4
(with whip antenna?)

7 element Yagi Antennas 3
3 element Yagi Antennas 6

Spilsbury SBX 121 SSB 1

Stephens SSB Radio + ant Box tuner 1
12V weather tight power supply box

Oh, by the way, there were some Kenwood R-5000 receivers, but I know about them :)

Bob -

I just got as PRO-2030 also - if you find the mod you're looking for I'd sure like to hear about it too.

I've found that my '2030 will tune up to 958 mHz - I think that this is a bit higher than the published factory specs.

Good luck finding the mod and *Please* share it wit the rest of us!

Bob - in Mississippi -

Has anyone heard MIR cosmonauts during space-walks? What frequencies do they use?

I heard MIR (R0MIR) on Christmas day and New Years day talking on 145.55MHz on some passes but on other passes there was audio on 145.44MHz that sounded like a recording " ... goodwill to people of all nations ...". Anyone know about this?

Best regards
Greg Hammond

While on UN duty in the Middle East I purchased a Sony ICF-PRO80 hand held scanner/receiver. It covers 150 khz to 223 mhz in wide am, narrow am, fm, narrow fm and SSB. It has 40 memories, three scan modes, pri, pgm, and dir digital entry/tuning. It is only 3 5/8 x 7 1/4 x 2 inches and is powered by 4 x AA cells plus 2 x AA for the freq converter (108 - 223 Mhz). It has worked great for me as both a general purpose radio, sw reciever and uhf/vhf scanner. Alas it only goes to 223 mhz and ohly has 40 memories. It is still sold at the Sony store here in Sunny Brandon Manitoba. Hope this helps.

Carl.

Same observations here, though FWIW except from Sunday night and Friday
afternoons, I'm always monitoring from a dorm room where listening to the
NYC news stations (880 and 1010 AM) is _very_ iffy.

(I can hear NYPD, FDNY and NYC*EMS sirens better by standing outside my
building door than I can hear the news broadcasts of what's happening
across the river.)

145.55MHz is what Amateur Radio Operators listen on when communicating with MIR and the Space Shuttle. It is the downlink frequency. Sometimes there is voice, sometimes there is Packet. HAMs use different frequencies as uplink frequencies. The next shuttle mission will have a SAREX experiment on it, so listen on 145.55 when the shuttle is overhead (I think it is going up the end of the month, Discovery I believe). I know that here in Michigan, due to the orbit the shuttle will be in, we will have some prime listening/communicating time and one of the Russian cosmonouts will be on board as well. I also believe you can get a QSL card for just hearing the station as well as communicating with it 2 way.

The modification was uploaded to ham.eetech.mcgill.ca about 6 months ago,
but the machine seems to be disappeared. If someone knows a ftp-server
for modifications, please let me know.
I post here the procedure. Any feedback is welcome.

Ylo Mets.

****

Updated fix of the synchronous detector of Grundig
Satellit 500.
August 5, 1993

Grundig Satellit 500 is known for its inferior synchronous
detector. There are two problems with it:
1) excessive distortion, especially in the SSB mode, and
2) its synchronous SSB mode cannot be activated via the keyboard
and processor.
For the excessive distortion there are two reasons:
1) too high DC voltage at the output of the detector chip CX857
(this may have slight effect on normal AM also), and
2) low frequency (50-200 Hz) feedback to the VCO of the first mixer
(this affects only SSB).
The voltage at the outputs can be corrected in two ways. The easier
way is to connect a 24-33 kohm resistor from each output (pins 7
and 8) to ground. If you don't have the service manual, the
correct points are positive pins of electrolytic capacitors C825
and C826. These capacitors can be found next to the larger
shielded box on the RF board, on the side close to the
loudspeaker. After installing these resistors the suppression of
the unwanted sideband improved in my receiver from 14 dB to
20-26 dB, and I think the distortion is reduced too.

The correct way to do this would be to install two omitted
components: one 1N4148 diode in place of a jumper under the metal
shield of the detector, and one 33 kohm chip resistor from
pin 7 of the chip to ground (there is a place for it on the

board). These will have similar effect, perhaps result in slightly better unwanted sideband suppression in SSB mode without additional balancing (as described later). These components are shown on the factory test circuits of the chip and also in the article on synchronous detection by Mike Gruber in QEX, Sept. '92, pp. 9-16.

The feedback from the audio stages to the frequency of the first mixer oscillator can be reduced by connecting a 2000 microfarad or larger capacitor from the AM +3.5 V to ground (pin 11 in connector A). This reduces also the hum in synch mode, when operating off the mains. The better way could be building a separate better 3.5 V regulator and switch it with AM +5V. This could improve also the operation of the synch detector with NiCads, which seem to have a bit too low voltage now.

For switching the detector to selectable sideband synchronous mode the pin 3 of connector C on the RF board must be grounded and the wire from the pin 4 of connector B must be disconnected. This can be done with a switch with two groups of contacts. This switch will then affect only the USB and LSB mode. With the switch activated the SSB mode will mean synchronous SSB. The ground connection can be done via 1 kohm resistor, this avoids problems in case of false connection, and also reduces extra interference from the processor. The detector circuit uses the phasing method to select one sideband, and therefore the phase noise of local oscillators creates clearly audible background (about 20 dB below audio). Also, the shielded oscillators exhibit strong microphone effect, resulting in audio feedback at higher volume.

Some hints for opening: the best screwdriver is Pozidrive #1. Ordinary Phillips does not fit well, and the screws are quite tight for the first few times to unscrew. The back cover should be lifted at the bottom side, there are plastic hooks at the top side. The RF board can be removed completely after unscrewing the 5 screws and unplugging all connectors. There MAY be an extra capacitor soldered between the RF board and the shield of the processor unit, in the vicinity of the antenna socket. It must be then unsoldered too.
The board is manufactured using surface mount components, so certain caution and fine tipped soldering iron is necessary. Care must be taken also when soldering the connector wires. These wires go directly to the microprocrssor pins, so static and other voltage differences between the tools and the radio should be avoided. The simplest way is to disconnect the radio from everything during soldering.
The procedure should be undertaken only if you are sure that your detector is defective too. This can be determined by viewing the suppressed sideband signal of about 500 Hz with an oscilloscope connected to line output, it must be severely

distorted

The unwanted sideband rejection can be further improved, but
for this the service manual, a signal source (signal generator
or a transmitter with clean carrier) and an AC voltage meter or
oscilloscope is needed. The procedure is balancing the summing
resistors after the audio phase shift circuits. Resistors in
question are CR834/CR832 for LSB and CR833/CR831 for USB.
The results on my receiver are following (the frequency of the
best suppression depends on actual component values in the phase
shifters and is probably different for other units):

Freq. [kHz] USB [dB] LSB [dB]

0.2 15 14
0.5 16 15
1.0 26 24
1.6 48 42
2.0 36 36
2.5 29 28
3.0 25 24
3.6 22 20

For proper balance CR834 was reduced by 10% and CR833 by 20%,
but I am sure this is different on each sample. The best
suppression value says also something about the distortion.

WARNING: you repeat these procedures at your own risk. Any
warranty will be void after these modifications.

Hello Scanner Guys & Girls:

I am not a very happy camper today. I heard yesterday
that my favorite frequencies are going to be scrambled.

Apparently they are not going to change frequencies and
they are now in the 150-155 Mhz range. What are the most
popular scrambling techniques? What do you need to unscramble?
I currently own a Pro-44 and am not very happy with it so
I would be willing to invest if neccessary. Ideally a device
that attaches to the pro-44 would be nice.

: plugged the cable into their scanner and found anything other than TV
: audio such as cable co. workers, packet radio, etc.? Also, would the
: so-called "bullet" pose any threat to scanners on the cable?
:
A while ago I plugged my 75ohm cable jack into my scanner and searched
from 30-960MHZ (took about a half our), but all I heard was cable tv
audio, the howl of the video signals, and a variety of what sounded
like data transmissions. The data transmissions were probably for
control of customer boxes and other devices along the transmission line.
I'm not sure what you refer to as the "bullet", but I can guess you
mean the data burst that disables an illegal cable box. Since your
scanner is simply a reciever picking up RF signals, it should not
be harmed in any way with this bullet. If it was harmful enough to
damage your scanner, it would certainly also zap your television.
I believe the "bullet" disables a cable box via some sort of digital
firmware or hardware code, not as a voltage spike or surge.

You might have better luck monitoring state police (trooper or highway patrol etc) or county frequencies. Especially the TAC and car-car freqs. The SS freqs are fine, but usually scrambled - which gets boring very fast.

Discone antennas are probably the most commonly used omni aircraft
Discone antennas are probably the most commonly used omni aircraft
antennas. These are Base antennas, however. For something quick
and dirty,& portable, try a FM radio antenna, the frequencies are
close enough that it might work (the twin-lead kind).

: and how to fix it. (If you tap on the case, you hear it in the speaker)
: I suspect that something is needing some glue.
:
: Also, I need the VHF marine freqs, especially ch 16 (most used)
: I believe they are in the 150 MHZ range. Thanks.

Microphonics is wierd stuff. I have an old OLD tube SW receiver and
you tap the knob and it sounds like an echo chamber thru the
speaker. An interesting novelty.

As for your scanner, I would open it up an inspect the inductors (small
copper coils), the capacitors, and the enclosed inductors (the squarish
small metal cans with hole in top) for loosness. It's the simple
physical vibration in the parts that causes current to be modulated
in and around and between various components. That's why you
sometimes see wax globbed all over the circuit board - to keep
things from jiggling and creating the microphonics you describe.
I suppose you could cast the entire circuit board in acrylic to
keep things still, but would be HELL to repair :-)

Hope it helps.

The cellular modification for the Pro-43 involves moving a diode from one position to another. I have removed the diode from its original position, but it was damaged in the process. My question is: Does anyone know the specifications of that diode and how I can get a replacement in order to complete the modification?

Chip Fenno (fenno@jupiter1.mae.ncsu.edu)

Source record: 278049

Actually I got 2 scanners. The Mrs., unable to determine which I would prefer, gave me 1 RS (unknown model, already returned) and 1 Bearcat 350A. Both 50 channel, neither covered 800MHZ, but the BC had better sensitivity and higher audio power output. We have been having a great time with the BC. (The Mrs. now realizes this gift was a big mistake because she had a number of rec.woodworking projects lined up for me but I can't hear the Scanner over the table saw...) Of course, now that I have read the Scanner Intro etc by Bob Parnass, (nice work BTW. Is this == the FAQ for this group?) I may take this one back and spend a little more on something better. Something < $200 though as I dont think I can justify more....

I have couple of questions though. I have the 1992 edition of Police Call, is it worth it to buy the 1993(4?) edition? Also the info available on disk from Grove sounds intriguing, how often is this updated?
I am having trouble identifying the signals/codes/APCO 10 codes used by our local and state police. Some are fairly obvious but not even the State Police match up with whats published in my copy of Police Call.
Is there a better source? (I scan in Central NJ, Jackson to be precise)

I was quite surprised to hear the State Police mobiles from about 80 miles away, loud and clear. Would this be some sort of repeater set-up?

Scanner happy in NJ

I would recommend the 1994 Police Call. You never know when a frequency is gonna change from one year to the next. In fact, my local PD went from VHF Low simplex to an new UHF Mobile Relay repeater system and was good to have my '94 Police Call. Each year they add a little bit more useful info. I always read thru the informative section at the beginning about the basics of scanning and public service radio. It's a good refresher, and always pick up some new tidbit. IMHO worth the $10.

Mike

97. Pro-43 mod for 108-118MHz coverage?

Newsgroup: rec.radio.scanner
Date: 1994-01-05 20:03:02 UTC
From: pwd@apple.com
Message-ID: <pwd-050194120302@mac219.kip.apple.com>
Source record: 278054
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

Is there a known mod for Radio Shack's Pro-43 scanner to allow coverage in the 108-118MHz band? There are some aeronautical frequencies of interest there. Some other RS Pro-xx scanners cover from 108MHz up, but the Pro-43 starts at 118MHz for some reason.

Thanks - any pointers would be greatly appreciated!
-Patrick Penzias Dirks.

98. Cellular Mod for late model BC200/205XLT

Newsgroup: rec.radio.scanner
Date: 1994-01-05 20:10:00 UTC
From: danclark@nssdca.gsfc.nasa.gov
Message-ID: <5JAN199416100439@nssdca.gsfc.nasa.gov>
Source record: 278055

I purchased this mod from Grove Enterprises for $2, it works great with the new version of the BC200/205XLT. Could someone please place this in the appropriate FTP location.

This is word for word from the letter I received from Grove, with the exception of words in brackets.

Note: It is unlawful to monitor mobile telephone conversations, including cellular. Although the procedure described below will restore the missing cellular freq. to your radio, it is possible to hear this range without any modification whatsoever by tuning in the image freq 21.6 MHz higher than the deleted ranges. Cellular calls will be heard from 894.01-915.6 MHz on your scanner without restoration.

The freq. deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises [and myself] assume no liability for damage caused by this procedure. The modification will void your warranty.

[Note: I performed this modification with little problems on a scanner I purchased in 1/94 (the newer model BC200XLT)]

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters

1. Slide off the battery pack, and remove the antenna from the scanner.

2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base, and the spring itself.

3. Carefully pry the bottom of the rear cover from the radio and remove the cover.

4. Locate two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and seperate them.

5. Consulting the illustration [see below], locate the microprocessor IC labelled "UNIDEN UC-1147 [or UC-1147A]" and the 10k ohm (brown-black-orange) leadless resistor [mine was labelled 103] positioned above the letters DEN on the IC.

6. VERY CAREFULLY solder a 1/8 watt (preferrable) or 1/4 watt resistor, any resistance 2.2K through 10K ohms, from the left side of the resistor located in step 5 and pin 8 of the adjacent K1013 as shown.

REASSSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual-inline connector at the bottom of the board with the mating socket, press the front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place, switch the scanner on to make sure the display comes on. If not, the battery is discharged or the dual-inline connector was misaligned during assembly (see step 7)

Assuming the display comes on, press: MANUAL, 845.0, E; within two seconds the frequency 845.000 should appear on the display.

[Like I said earlier, I performed this mod easily. The only difference is that the resistor said 103 and the chip was 1147A. Please also note that the chip in their diagram said 1147A, but their text said 1147.]

```
---
K1013 --> -[ ]-
-[ ]-
-[ ]-
Added resistor--> /--[ ]--------[ ]-
/ ---
brown-black orange or 103--> [ ]

-----------------
[ UNIDEN ]
[ ]
[ UC-1147A ]
[ ]

as camter28 very nicely and politely said to me via e-mail, what I wrote here is wrong, wrong, wrong. In fact, it isn't even wrong. Bill Cheek's books primarily cover the 2004, 2005, and 2006. I saw "2024" and read it as "2004" in the original question...

(Uh, my news feed dropped a bit, turning the second '2' into a '0'! Yeah! That's it...!)

Sigh.

Your money would be better spent on a company called "Antenna Specialist". They perform far better than any RS antenna. A/S mfrs. pro antennas also, so the designs and mounts are better and more plentiful. I've used both, and RS can't come close to A/S.

They probably start there because that's the bottom of the aviation comm band...freqs between 108 and 118 are primarily navigation signals. Yes, I know there's a lot of good voice (ATIS and such) down there, but I didn't design the thing. :-)

107. Pro 2030 Mod?

Newsgroup: rec.radio.scanner
Date: 1994-01-06 03:13:08 UTC
From: Jerry.Smith@f747.n115.z1.fidonet.org
Message-ID: <757877429.AA01713@chigate.fidonet.org>
Source record: 277927

Hi, Bob...

BE>I just bought a Pro 2030 last weekend and really like it. I'm wondering if
BE>there's a mod to allow reception of all 800Mhz frequencies.

Yes!! The following will do it...

Product: Realistic PRO-2030 by Radio Shack
Purpose: Restore full 800 Mhz coverage

** Disclaimer...Modification of receiver will void the warranty of your
unit. All modifications are done at your own risk.

** Monitoring of certain areas of the 800 Mhz band are prohibited by
federal law.

Modification of PRO-2030 for full 800 Mhz coverage with 30 khz
stepping available.

1. Take out the screws at the bottom to open the 2030.
2. Look down into the top of the unit, behind the front panel, and
locate a metal loop labeled L201.
3. Clip that part and move the two pieces slightly away from each other.
4. Re-assemble unit.

If your unit ever needs service, you can bend the two pieces back
together and no one would know that the part had ever been snipped, due
to it's rigidity.

>sure like to hear about it too.
>

Below is the mod as I retrieved it from CompuServe:

Anyways, take out the screws so you can open up the 2030.
Looking down into the top of the scanner right behind the
front panel you'll notice a little metal loop that's labeled
L201. CLIP that jumper and move the two pieces a little away
from each other. The loop's so small and rigid that if you
ever need service, you could bend the to parts together and
nobody would know you snipped them.

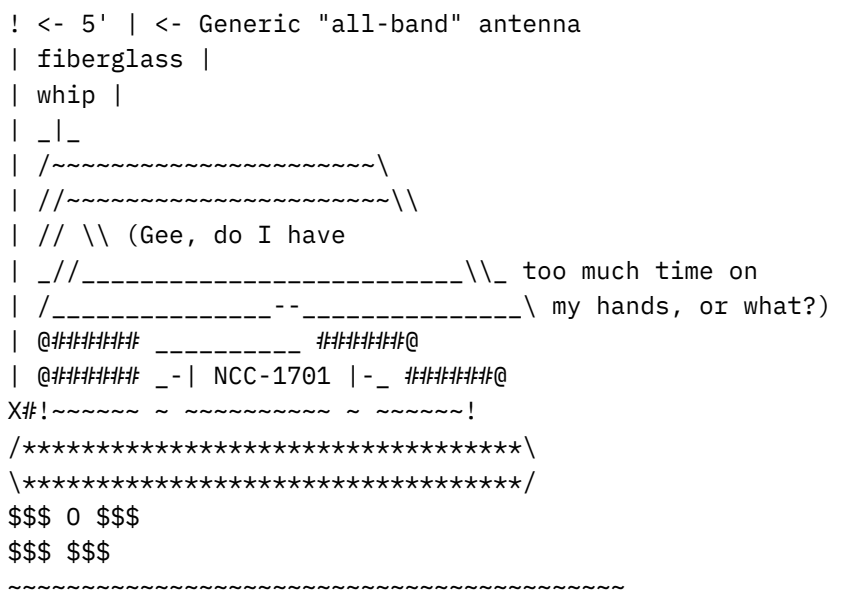
: Thanks for your help,
: Danny

I have two receiving antennae on my car, one of them is a generic multi-band antenna that boasts coverage from 30Mhz-1Ghz, and the other is the 8.6ft Fiberglass whip that RS sells, cut off at exactly 5 feet.

For 46-49 Mhz the 5' modified fiberglass whip outperformes the multi-band antenna by a long shot. It also picks up the aircraft band (118-136) really well, even though it's off freq. for it. I have the 5' antenna mounted to the clamp-mount that RS sells, which I mounted to the left-rear quarter-panel of the body of my car (behind the rear wheel) by drilling four holes for the screws that are used to mount the clamp and just securing it to the body. Works great, and cheaper than many of the multi-band antennas, too.



Just my $.02 worth.

Dear Scanner Friends:

I just got my parents a new scanner for Xmas. They live near Edmond,Ok.
Does anyone out there in "scanner land" have any interesting freq's for
that area that I can give to them? An example of something I am trying
to find out for them is the ham repeater freq in that area that broadcasts
the NASA Space Shuttle flights...

As I do not daily read the News Groups, direct email would be
appreciated.

Thanks in advance,

Jerry Morrison

I just bought a used BC160 for use on my desk here at work. The only thing that could use some modification is the priority. When it jumps from an active channel there is a loud (and rude) pop. This can be very annoying and my fellow co-workers let me know it :-(.

Does anyone have any ideas/mods to quite this priority down a bit?

NOTE: I sent the original poster my reviews of both the PRO-43
and 200XLT scanners. Here is a reprint of an old article.
PS - I prefer the PRO-43.

SCANNER SHOOTOUT:
RADIO SHACK PRO-43 VS. UNIDEN/BEARCAT 200XLT

by Bob Parnass, AJ9S

The Uniden/Bearcat 200XLT and Radio Shack PRO-43 are both
excellent portable scanners. Which one is right for you?
Here's a table to help see the differences.

Criteria	PRO-43	200XLT
discount price	$275	$240
discounter	Marymac Industries Houston, TX	National Tower Co. Shawnee Mission, KS. Grove Enterprises, Brasstown, NC
special frequency coverage:		
29-30?	no	yes
220-225?	yes	no
225-400?	yes	no
54-88?	yes, add diode	no
cellular bands?	yes, remove diode 30 kHz steps	yes, remove resistor 12.5 kHz steps
IF circuitry	up conversion, 610, 48.5, 0.455 MHz	conventional 10.85, 0.450 MHz
sensitivity	better on 800 MHz	
audio output		stronger, clearer
scan speed (ch/sec)	50 measured	15
rubber antenna	ok	poor 800 MHz performance
images	none noted	yes, on VHF-hi, UHF, and in cellular band
intermodulation	yes, noted on VHF-hi band. more intermod	yes, noted on VHF-hi band less intermod

size	smaller	larger
case ruggedness	even	even
display readability	smaller	easier to read
display light	dim,	easier to read,
	not latched	latched
keypad	monochromatic	color coded
keypad beep tone?	yes	no
battery system	replaceable AA	monolithic
		NiCd pack included
AC adapter	optional	included
leather case	none	included
belt clip	included	none
_____	_____	_____
monitor memories?	yes	no
freq query?	no	yes
AM/FM user selection?	yes	no
priority channels	1	10
AC operation modes:		
operate on AC		
while charging		
batteries?	yes, with $7	yes, adapter
	AC adapter	included
operate on AC		
without charging		
batteries?	yes, with $7	no
	AC adapter

Bruce James Robert Linley (linley@netcom.com) wrote:

: Yup. 823.950-850.980, 868.980-895.980 in 30kHz steps.
: Also (once enabled) 54-88 MHz in 5kHz steps.

I noticed that after a friend modified my Pro 43 that I get 54-88, which allows me to get TV channels 2, 4, and 6 (they sound muffled since it's narrow FM but they're listenable). Lately I'm noticing some pager/NOAA weather interference on 145-155 MHz channels while scanning preprogrammed channels. This doesn't happen on the 2006 or on my Pro 39. Is something wrong with my Pro 43?

Also, the Pro 43 is a battery pig. The Pro 39 lasts much longer and doesn't draw so much from the AC adapter. The Pro 43 draws so much current it creates an audible hum when using an external speaker.

I wrote this a few months back, but I'll re-post it again:
- - - - - - -

A TALE OF TWO SCANNERS

~~~~~~
The Pro 39 and the Pro 43: A General Comparison
by John Quill Taylor

~~~~~~

This is a general yet practical comparison between two popular Realistic(TM) Brand portable scanners, the Pro 39 and the Pro 43. This is not an in-depth technical comparison, as these have been written already. This is a comparison from my own experience using both scanners. I've had a Pro 39 for seven months, and a Pro 43 was just acquired recently, so my report is probably biased toward the Pro 39, with which I am more familiar.

Overall Impressions and complaints:
==========

The Pro 39 & Pro 43 have some major differences and some subtle differences. The subtle differences can be surprising. For example, the beep confirmation tone is about one whole note higher in frequency on the Pro 39 than on the Pro 43! Also, each radio has its own "personal" behavior: the quality (or lack thereof) of its sound, the brightness (darkness?) of the internal lamp, and the ease with which you can read (or not read) the LCD display, all vary between one radio and another, even of the same model!

In MANUAL mode, both radios have a STANDBY feature that allows the scanner to consume less power, but the Pro 39 has about a 50% duty cycle (0.7

seconds OFF followed by 0.7 seconds ON) whereas the Pro 43 has about an 85% duty cycle (1 second OFF followed by 5 seconds ON). Both radios go into STANDBY after about 5 seconds. The STANDBY circuit produces and audible thump in an external speaker. Due to the 50% duty cycle of the Pro 39, this "thump" sounds exactly like the lead-in and fade-out to Pink Floyd's "Dark Side of the Moon". Try it! When using an AC adapter (either charging or powering), an audible hum is heard when using an external speaker.

What's GOOD about BOTH the Pro 39 & the Pro 43:
==========

Both of these radios share the same small footprint (more like thumbprint!). They use the same battery pack (6 AAs), AC and DC adapters (9V), and have a similar look and feel, including the antenna connector (BNC), earphone connector (1/8"), and squelch and volume knobs. Both radios can be modified to restore full 800 MHz coverage, and modifications exist to eliminate the beep and improve the sound.

What's BAD about BOTH the Pro 39 & the Pro 43:
==========

Although a modification exists to defeat the beep confirmation tone, a switch to enable or disable it would have been nice. The sound of the beep when using headphones or an external speaker is quite obnoxious, but the beep is somewhat useful during programming, since the buttons are rather small.

The belt clip is a piece of trash. Granted, it only costs a dollar to replace (at Radio Shack); I've spent three dollars more than I care to have spent on this weakly designed part. Luckily, its failures have not caused any damage to the radio itself, a very real possibility.

The internal speaker's in both radios suck.

On my Pro 39, I once was removing the batteries while the power was on, and I lost all the frequencies! I am unsure whether this can happen to the Pro 43, but I recommend turning the power off before taking the battery pack out and leaving it off until the pack is securely in place.

When in PRIORITY mode, the scanners often "leap" from a frequency with a solid carrier. Also, during the "sampling" of the priority channel, the radio often "misses" a pressed button, requiring you to press it again. These little "bugs" occur also on the Pro 2006.

What's GOOD about the Pro 39:
==========

The Pro 39 has a lower price.

The Pro 39 has a much easier to read LCD, at least on the radios I have seen. I returned my first Pro 43 because the display was hardly readable.

The Pro 39 uses less than half the current drain as compared to the Pro 43 (according to published specifications). This was my initial reason for

getting a Pro 39 versus a Pro 43. Where does all that power go in the Pro 43? Is it the triple conversion? Is it the triple conversion? Is it the triple conversion? Who knows?

While the internal speakers are awful in both models, my Pro 39 has a much better sound. It is, in a quiet room, even "listenable." The Pro 43 speaker "cracks up" (this may be the fault of the audio amplifier, since both radios perform well with headphones or an external speaker).

The general "behavior" of the Pro 39 seems a bit more "positive" to me, although I have owned this radio much longer than my Pro 43. When scanning, pressing LOCKOUT works immediately on the Pro 39, while it seems to hesitate a brief moment on my Pro 43.

What's GOOD about the Pro 43:
==========

The Pro 43 has a few extra front panel features that are nice, like an AM/FM button. The Pro 39 "assumes" AM mode in certain frequency ranges, and this mode cannot be "overridden" with a button like the Pro 43.

The Pro 43 scans in both directions, from lower to higher channels (default "wakeup" mode, like the Pro 39) and also from higher to lower channels. This is a subtle but very handy feature that allows you simple way to "bounce" back and forth between two closely spaced "hot" frequencies.

The Pro 43 features triple conversion (versus double on the pro 39). I didn't think this was a big deal, especially if you live in a "little" town like I do, and I still don't think it's a big deal if all you do is scan the programmed channels. Where triple conversion pays off is during searches, but since neither radio has "frequency lockouts" during search mode, both radios will "hang" on dead carriers, birdies, etc. during searches.

The Pro 43 has a shorter antenna (about 1/2" shorter). It is also narrower (about 1/8" narrower).

The Pro 43 "remembers" the channels without batteries, although many times I have left my Pro 39 on all night (after the batteries expired) and the frequencies were still there. Maybe I am just lucky.

The Pro 43 has better frequency coverage (see the Radio Shack Catalog).

The Verdict:
==========

The Pro 39 is less expensive but it only uses double conversion. The Pro 43 uses triple conversion, and yet it uses more power, has a more difficult to read LCD, and sounds worse using the internal speaker. While some great discounts can be had on both of these radios, I strongly recommend holding and operating both radios side by side before buying, and, if I had to do it again, I would buy them in person, since it appears that each radio varies in its LCD display and sound quality.

Radio Shack closed out the PRO-34's about two and a half years ago.
Every once in a while you can find one floating around, but you'll
probably have to get one from a private individual. I've had my PRO-37
for two years now, I work for Radio Shack, and we no longer carried the
PRO-34 when I bought my PRO-37. The PRO-34 is a good scanner, so don't
give up the search for one. Good luck.

From article <CJ5z9t.345r@austin.ibm.com>, by blood@austin.ibm.com ():
>
> Anyone familiar with the Microphonic problem I have at 800MHZ with the PRO-34

> Also, I need the VHF marine freqs, especially ch 16 (most used)
> I believe they are in the 150 MHZ range. Thanks.

channel 16 may be the most used, but probably shouldn't be. It is the
international distress and calling freq. It can be used for other than
emergencies, but only to make initial contact.

Don't know about your microphonics problem, I'll let someone else answer
that, but I do have some of the marine VHF freqs. I've been looking
for them myself and found the following in "Radio Aids to Marine
Navigation" published by the Canadian Coast Guard. I'm sure the
frequency allocations are the same as in the US for the lower, simplex
channels, but the use and allocation of some of the upper, duplex
channels may vary. Also, my list may be incomplete. Additions or
corrections from anyone are welcome.

ch 6 156.3
ch 8 156.4
ch 9 156.45
ch10 156.5
ch11 156.55
ch12 156.6
ch13 156.65
ch14 156.7
ch16 156.8

special use and duplex channels:

ch ship freq. shore sta. use

21B none 161.65 weather and NOTSHIP broadcasts
22A 157.1 157.1
25B none 161.85 weather and NOTSHIP broadcasts
26 157.3 161.9
27 157.35 161.95
83B none 161.775 weather and NOTSHIP broadcasts
85 157.275 161.875
87 157.375 161.975
88 157.425 162.025

NOTSHIP is a "notice to shipping." Also of interest are the NOAA
weather broadcasts on 162.400 and 162.550 MHz. (I think there are

also other, lesser used freqs between these two primary ones.)

That's all I've got so far, but am also looking for more complete info.

Thanks...
-billp

Just a small correction:

In article <2geei7$r9j@umcc.umcc.umich.edu>,
Matthew Scott Weisberg <moodyblu@umcc.umcc.umich.edu> wrote:
>145.55MHz is what Amateur Radio Operators listen on when communicating with
>MIR and the Space Shuttle. It is the downlink frequency. Sometimes there
>is voice, sometimes there is Packet. HAMs use different frequencies as
>uplink frequencies. The next shuttle mission will have a SAREX experiment

This is NOT the case for Mir, but it is correct for the SAREX missions.
Mir contacts are always done simplex on 145.55. On SAREX missions there
are several uplink frequencies and you have to pick one roulette-style.
If you're on the right one, you may get a contact, if not, you're outta luck.

--
Tim Russell russell@spdcc.com
Most people would rather have comfort than freedom. The paradox is that you
can't really have the former, in the long term, unless you have the latter.

125. Uniden Bearcat 100xl scanner

Newsgroup: rec.radio.scanner
Date: 1994-01-06 17:52:36 UTC
From: aragorn@csd4.csd.uwm.edu
Message-ID: <2ghj54INN8c7@uwm.edu>
Source record: 277928

I recently acquired a Bearcat 100xl scanner from a friend and I have a few questions about the unit since I'm a bit unfamiliar with scanners, generally.

1.) On the back of the unit it states that I must use rechargeable batteries. Is this the case or is this just a suggestion because of the nature of the unit?

2.) I am in need of a listing of police/emergency listening frequencies for my area, Milwaukee, Wisconsin. Are there any published lists or anything similar on the Net via ftp/gopher?

3.) Is this an older unit which would make finding the ops manual for it diffucult?

Please reply via e-mail since I don't read this newgroups regularly. I'd be happy to re-post any replies back to the newsgroup. Thanks in advance...

What exactly are the problems with the sync detector of Satellit 700?
I have never tried it, but might make some guesses based on the
circuit diagram and experience with Satellit 500.

With best regards,

I have one and like it. Recently I was curious how it compared to a 'real'
scanner antenna, so I switched to a magnetic mount full coverage whip
on the roof of my van. The splitter/car antenna worked much better, so
that is what I continue to use. I suppose that my brief use did not
give it a fair evaluation on all bands - but UHF and VHF-LO were stronger
with the splitter.

Well, Good idea (and especially a good drawing (yes, you're bored) of the car) about the 5' fiberglass. My idea: take a regular 5 foot or so CB antenna and use unmodified. Lot faster to mount when the clip's already there...

Anyway, it's tuned only 19 MHz away (since CB is at 27 MHz), so reception is still very good. I can hear cordless (your frequency tells me that) phones probably a good half mile or more away, and baby monitors quite clearly as well. The reception on 155 MHz and even on 450-460 MHz is quite better than rubber duckie inside of a car, lying down on the seat. It must work on the basic idea that the more metal up there, the better, even if it's not tuned for that frequency. With the CB antenna, I can hear the low powered mobile handheld repeaters at 458 Mhz at a range of some three miles, and they're meant for extremely short-range communications by the state PD. So I always use the CB antenna as is, and am quite pleased by results (and cost, too, since someone was throwing it out a couple years ago... :)

PRO-3
BL>and how to fix it. (If you tap on the case, you hear it in the speaker)
BL>I suspect that something is needing some glue.

BL>Also, I need the VHF marine freqs, especially ch 16 (most used)
BL>I believe they are in the 150 MHZ range. Thanks.

I had the same problem with my 34 awhile back. Apparrently, one of
the coils would vibrate when the scanner was up at full volume when
monitering 800 Mhz. I took a piece of thin foam and placed it on one
of the coils. I forget which one it is, but the best thing to do is
to open the unit and then operate the scanner in the 800 mhz band.
Then, with a screwdriver, tap around each of the coils until you hear
the feedback of the tapping. Tap a piece of foam on this coil. It
will not totally eliminate it, but will minimize it enough to be
tolerable.

> like data transmissions.

I did the same a few months ago. And I compared the contents of my
cable TV outlet with the feed at my folks house in another community
(about 150 miles from here).

I didn't find anything out of the expected on either system - nothing that
wasn't available on a TV or FMBC receiver. However, the experiment was not
a complete failure. We had not previously hooked up FMBC radios to our
cable systems, so we were unaware of what was being fed to us on that band.
Here in Arlington (just outside Dallas), there are a couple of really nice
FMBC stations being fed from satellite that I have taken to.

At the folks place in Kilgore, I found a couple of the Dallas stations that
were not ordinarily receivable using "consumer-grade antennas."

I am pleased to note that there is minimal interference on either CATV
system from those leaky, inconsiderate civil aviation stations. :-)

Cheerio!

> tv20 television station.

I'm afraid the TV ch 20 image is a known problem with the PRO43 (and
the PRO-2005/6). The strong TV signal is entering through the case and
mixing with the 2nd local oscillator. At one point in the tuning range
this produces an image that the 2nd I.F. accepts. Since the 2nd L.O.
repeatedly scans through a 3.2 MHz range as you tune, the image occurs
repeatedly, at 3.2 MHz intervals.

You could: 1) shield the inside of the case (foil, copper, shielding
spray); 2) move; 3) improve the S.F. skyline with some TNT; or 4) learn
to live with it.

The foam sounds like a fine solution, but keep in mind that these are TUNED COILS you are playing with. Any alteration of their shape in any way can alter their performance. i.e. It will change the way your scanner receives or filters RF signals (however for RS scanners you might improve things :O).

Yes. Many folks get their weather data live from APT (automatic picture transmission) satellites. These birds are polar orbiters and use freqs in the 137MHz range. Most scanners are not useful for this purposes however since they do not have a wide enuf bandwidth for the doppler shifted signal. However, a simple demodulator, a IBM PC and suitable software can easily decode the signal. Most of the geostationary birds use 1650MHz for the down link, again making most scanners unusable. Contact Software Systems Consultants for good weather satellite software. For THE book on weather sats, check out Dr. Ralph Taggarts Weather Satellite Handbook (published by the ARRL).

The antenna will have a coax cable attached to it. If you use a Mag mount then the cable will need to enter the car through a window or door. On the end of the cable will be a BNC or PL-259 connector. If it is a PL-259 (UHF) connector, then you need to get a UHF to BNC adaptor. The antenna connector on the top of your Pro-43 is a BNC (female). You just lock the connector on to your scanner the same way your rubber antenna attaches.

There is no such thing as the "so-called bullet" at least not in the sense
of the cable company sending something damaging to electronic equipment
down the line. If the cable company was doing this, and destroying people's
TVs and VCRs, it would be law-suit city. The "bullet" that people refer
to is simply the cable company finding a new way to block a test chip
from receiving unauthorized channels. The name sounds threatening, but
you probably have more to worry about from unexpected noise on the line.

Help!
I am trying to send email to Bob Parnass, who maintains the FAQs on this
newsgroup, but I keep getting host unkown.

The address I have is <parnass@ih4gp.att.com>.
Can anyone verify this address or give me another?

Thanks in advance, Frank.

152. Re: THOUGHTS ON RS PRO 43 SCANNER?

Newsgroup: rec.radio.scanner
Date: 1994-01-08 02:09:43 UTC
From: norman@cs.toronto.edu
Message-ID: <94Jan7.210921est.48141@neat.cs.toronto.edu>
Source record: 277957
Cross-posted to: alt.radio.scanner,rec.radio.scanner

A minor nit in John Taylor's posting: his claim that the Pro 43's standby mode involves an 85% duty cycle (5 seconds running at full current, one second of standby) is contradicted by both manual and measurement. The manual claims that the cycle is .25 sec at full current, one second at standby, `which uses only 30% of the normal power.' I don't have a meter that's responsive enough to measure that sort of interval exactly, but I can see that the time at full current is quite short, much less than a second, and can measure that the whole cycle (full-current time plus standby time) takes about 1.2 or 1.3 seconds. (More exactly, 30 cycles take about 38 seconds, with some unknown eye-hand-coordination lag.)

My experience is that even when scanning (but with relatively few signals, and with the volume low) I can get at least 12 hours of continuous use out of a fully-charged set of brand X rechargables.

153. Problem with Scanning in Car

Newsgroup: rec.radio.scanner
Date: 1994-01-08 05:22:55 UTC
From: g5g192@rick.cs.ubc.ca
Message-ID: <2glfvf$hdh@cs.ubc.ca>
Source record: 277959

I'd think this is a pretty frequent problem, but perhaps there's a way around it. When I'm scanning things in my car (say outside someone's house listening to a cordless phone) as soon as I turn on the car, I lose most of the signal. I think the car is putting out lots of interference because even when I unplug the power cord and work it off the batteries, it's no better.

I have a 1990 Subaru Legacy, and a Pro-43 Scanner.

Also, will getting an external antenna solve this problem? thanx!

154. Re: Antenna's for listening to 46.8 Mhz

Message-ID: <2glgk2$hgj@cs.ubc.ca>
Source record: 277960

I tried sending you email, but it didn't work, so here's what I
was going to ask:

BM> The antenna will have a coax cable attached to it. If you
BM> use a Mag mount then the cable will need to enter the car
BM> through a window or door. On the end of the cable will be a
BM> BNC or PL-259 connector. If it is a PL-259 (UHF) connector,
BM> then you need to get a UHF to BNC adaptor. The antenna
BM> connector on the top of your Pro-43 is a BNC (female). You
BM> just lock the connector on to your scanner the same way your
BM> rubber antenna attaches.

Two more questions. =). First of all, I can get all this at Radio
Shack, or is there somewhere else I should go to? Second of all,
how is the antenna going to mount? Will it damage the car in any
way? And where's the best place to mount the antenna? thanx!

155. Hey! Smart guys! Look inside!

: phones probably a good half mile or more away, and baby monitors quite
: clearly as well. The reception on 155 MHz and even on 450-460 MHz is
: quite better than rubber duckie inside of a car, lying down on the seat.
[Rest of desc. deleted]

Yeah, I also have a K40 on the roof of my car, and I used it for a
while.. My experience with using CB antennas is that the loading coil on
the base of the antenna tends to "eat" some of the signal.. esp. in the
higher freq's.. (Please excuse my crude terminology there, but I dunno
how else to describe it.) It did work well for the 46MHz band though,
since (as you stated) is isn't _too_ far off frequency.

Happy scanning!

Source record: 277962
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Some additional experience with a PRO-43's current consumption -

Condition Test 1 Test 2

Maximum audio 140 ma 150 ma
Normal audio 105 90
Squelched 82 85
Battery saver 80/6.3 80/6.5

Assuming the 20% duty cycle specified in the manual, the battery saver mode (manual, no signal) uses an average 21 ma.

Starting from a fresh full charge on standard Radio Shack NiCds, a continuous test (scan mode, minimum squelch, minimum volume i.e. receiving but no audio) produced a battery warning at 6h 4m and a dead radio 9m later. Assuming a current draw of ~90 ma, this is 540 mAh. The batteries are rated as 600mAh, which is in reasonable agreement.

Based on this, you can expect ~6 hrs scanning from 600mAh cells, depending on signal activity and volume. The battery saver mode could run for ~24 hrs on a quiet channel. Scale these figures up for higher capacity batteries.

>I believe they are in the 150 MHZ range. Thanks.

These run from 156.300 which is channel 6 to 157.300 or so. The spacing is 300 325 350 etc. 156.800 is channel 16. There is good listening on this band especially if you live near the water front. Try 156.350, channel 7, 156.600, channel 12, 156.650, channel 13, 156.425, channel 68 and others for hot action. Be sure to scan between 161.800 and 161.995 for ship to shore phone action. I have been listening for years to this stuff.

>
> Has anyone dealt with any of these companies, and if so, with
> what degree of satisfaction?

The following information was updated in mid-October with calls to all but the last two vendors. Where feedback is indicated, it represents comments in postings to the net. When dissatisfaction was expressed, it was primarily due to misunderstanding of what the FCC file actually contains.
The Master File contains stations licensed to specific frequencies, not those assigned to an entire band (i.e. hams, aero, marine, etc). It also contains multiple entries for specific licensees where they have several call signs, xmitters or locations. The FCC file also contains some typos (e.g. Atlanta, GA was spelled 7 different ways), so a little caution in using the data is indicated.

Superintendent of Documents orders (202) 783-3238
U.S. Government Printing Office
Washington, DC 20402.
The FCC rules and regulations are available as Title 47 of the Code of Federal Regulations (47 CFR). The five volumes cost from $12 to $20 each and are revised annually. Volume 1 (Parts 0 to 19) includes the 90-page Table of Frequency Allocations. Volume 5 (Parts 80 to End) covers the various mobile services. The GPO operates bookstores in major cities.

U.S. Department of Commerce orders (703) 487-4600
National Technical Information Service rush (800) 553-NTIS
5285 Port Royal Road Fax (703) 321-8547
Springfield, VA 22161
Supplies the Master Frequency File, subsets and indexes, on microfiche and 9-track magnetic tape. The State Index microfiche is ~$55 and includes frequency, name, city, state, call sign and service code. All the mag tape files cost more than $1000. NTIS has catalog extracts available describing the various FCC files, formats and prices (ask for PR-718-2 and PR-781-1).

ITS - International Transcription Service (202) 857-3800
1919 M Street, room 246
Washington, DC. 20554

Government copy contractor providing online access to FCC Data.
V.32/V.42bis, 9600 baud @ $100/hr, 2400 @ $50/hr. SQL Access is also
available online. Searches can be performed and data downloaded in
batch via Kermit. Custom Searches are availble with results on disk,
tape, or paper; cost varies by search ($1000.00++)
[Feedback: not for the hobbyist!]

Grove Enterprises, Inc orders (800) 438-8155
P.O. Box 98 office (704) 837-9200
Brasstown, NC 28902-0098
Offers the index to the Master file for individual states. File comes
on HD floppy disk and is dBase compatible. Access program and one state
is $39.95 (49.95 for CA, TX or FL) + 3.00 s/h. Updates are $29.95. A
nationwide file included with each state order. Also offers a national
railroad file for $29.95.
Fields are - freq., name, city, county, state, latitude & longitude,
call sign and service code.
[Feedback: established vendor, offering the index files since '91,
updated yearly. Many satisified users.]

PerCon Corporation (716) 386-6015
CD Applications Division Fax (716) 386-6013
4906 Maple Springs / Ellery Road
Bemus Point, NY 14712
Offers "a full line of FCC related databases" on CDROM and floppy disk.
Available are various subsets by service, state, etc. Formats are ASCII
and dBase compatible (access program provided with the CD-ROM version).
A single state CD-ROM (all frequencies) is currently $99.95.
Fields are - frequency, service code, type code, call sign
licensee: name, mailing address, city, state, zip, expiration date
number of mobiles: vehicle, portable, aircraft, marine, pager
transmitter: lat. & long., city, county, state, elevation,
antenna height, output power, ERP
[Feedback: several satisfied users.]

CET (800) 445-0297
1001 S. Ridgewood Ave.
Edgewater, FL 32132
Offers a file on floppy of all stations within a 30-mile radius of a
customer-specified location. The prices are: rural $80, metro $140,
super-metro $200 (printed list are one-half these prices). Available in
ASCII columnar and comma-delimited formats. Does not include stations
lacking a specific location (i.e. mobile-only systems).
Fields are essentially the same as described for PerCon.
[Feedback: some early confusion about prices due to erroneous postings
to the net. Users satisfied otherwise.]

Scanner Master (800) 722-6701
PO Box 428
Newton Highlands, MA 02161
Provides online "access to nearly the entire F.C.C. database and is

updated weekly". Includes all fields in the Master File records. Allows selective downloading by search criteria and reporting of particular fields. Charges are $25.00 for a users guide/membership kit and $1.50 /min (first 10 mins free).
Ref: Richard Barnett 71420.163@compuserve.com
[no feedback available]

ScanWare Associates (206) 698-1383
7910 NE Double Hitch Ct (206) 871-7099
Bremerton, WA 98310-3801 Fax (206) 698-8207
BBS (206) 871-4228
Offers its "FCC Frequency Retrieval System, Ver 1.15", a "database management system for the FCC Public Service Frequency Databases ..... includes program and FCC database for any state". No indication as to fields included (but sounds similar to Grove offering).
Program & one state, $29.95 (CA, TX or FL, $34.95); add'l states $15 ea (CA, FL, TX $20 ea); plus $5 s/h.
[no feedback available]

I have seen devices called "Nitelogger" that hooks up
to a scanner ,etc that uses a remote lead to activate the
recorder whenever the s quelch breaks. It will work with a ny
recorder witha remote on/off input. I had a similar device
some years back and it worked great. You could adjust the
sensitivity and duration of record after the message stopped.
E-mail me and I can give you info on how to order one.

If the problem is a strong emanation from the car's electronics, where it
causes the radio to "desense", an outside antenna may not help. Try putting
the radio just outside the vehicle and start it up. Do you lose signal
strength then? I bet the antenna will help you anyway, even when you lose
those weak cordless phone signals! Shame, shame! ;-)

Help!!!!!
I have recently purchased an ar-3000a scanner. I love the scanner so far and am picking up some great signals. I am having trouble with the little buttons though. I downloaded Chuck Shramek's windows program to run the scanner, but I cannot get it to work. I currently have a GVC 14,400 fax modem connected to com1 and have a M-1200 card in my second slot, could one of these be stopping me from using the software. I also purchased a straight rs232 cable to connect it with, not the modem type. Anyone with any info or insight please leave me a note. I would also like to hear from others who are using other software with the ar-3000a.
Thank you all.

Help!!!!!
I have recently purchased an ar-3000a scanner. I love the scanner
so far and am picking up some great signals. I am having trouble with
the little buttons though. I downloaded Chuck Shramek's windows program
to run the scanner, but I cannot get it to work. I currently have a GVC
14,400 fax modem connected to com1 and have a M-1200 card in my second
slot, could one of these be stopping me from using the software. I also
purchased a straight rs232 cable to connect it with, not the modem type.
Anyone with any info or insight please leave me a note. I would also
like to hear from others who are using other software with the ar-3000a.
Thank you all.

I have a M-1200 card for my ibm which is connected to a Ar-3000a scanner. I have been listening/reading packet at 1200 baud lately, but I am curious on how to recieve maps and fax. I live in Detroit, can anyone tell me some good frequencies that I can decode in the area.
Thanks,
Jeff Trudell

178. 2021 Speedup?

Newsgroup: rec.radio.scanner
Date: 1994-01-09 20:44:30 UTC
From: vasrat@shell.portal.com
Message-ID: <CJDqy7.25F@unix.portal.com>
Source record: 277985

Is there any way to speed up the scan rate of the Realistic PRO-2021 scanner? A quick peek at the service manual didn't reveal any obvious component like a crystal to replace. There are two pins on the CPU (49 and 50) which appear to be for speed control, and there's some sort of RC combination between them. Has anyone tried playing with this?

I have the Grove Enterprises databases on disk for NY and PA. I am
mostly satisfied with the information. The problems that I experience are
related to the age of my computer system.

I intend to buy a scanner shortly and have the choices down to the ICOM R7100 and R100. Anyone care to give their thoughts on the performance of either, and which might be better to get.

Richard Hoenes

183. Mast Head Amp needed??

Newsgroup: rec.radio.scanner
Date: 1994-01-10 00:10:27 UTC
From: jck@jaguar.catt.citri.edu.au
Message-ID: <1994Jan10.001027.23698@etrog.se.citri.edu.au>
Source record: 277988

Hi folks.

I have a PRO 2006 with a Diamond discone wideband antenna. It is positioned about 30 feet up on my roof. I used RG213 low loss (3/4 inch thick) 40m coax cable plugged directly into scanner. It works very well.

I was told that if I placed a mast head amp on the antenna I would pick up heaps more stuff and also improve a channel that I am having problems hearing as it fades in and out (SES UHF ch1 468.600MHz).

Is it worth getting one? What brands? I saw one in Dick Smith for $197.00 and it looked pretty good. It had variable gain etc..

PS: I may need to tranmit on this antenna as well so I assume I must turn off the amp or something to stop the amp blowing the radio finals??

Thanks in advance for any information.

Cheers

184. Pro-43 cellular mod difficulty

Newsgroup: rec.radio.scanner
Date: 1994-01-10 00:38:15 UTC
From: sita@ecf.toronto.edu
Message-ID: <CJE1rs.L7r@ecf.toronto.edu>
Source record: 277987

Can anyone give me an idea of the difficulty of the Pro-43 cellular modification? I'm deciding between the Pro-43 and BC200xlt and it might come down to which is more easily modifiable. From previous posts it seems like the 200xlt is quite easy. Any idea on the Pro-43?

Thanks!

185. Grove FCC Data

Newsgroup: rec.radio.scanner
Date: 1994-01-10 01:49:21 UTC
From: ksmith@theodolite.ae.calpoly.edu
Message-ID: <1994Jan10.014921.3366@cs.yale.edu>
Source record: 277989

I've recently inherited a Macintosh (a big improvement from my Apple][) and am interested in getting the Grove disks. Has anyone had success in converting the data for use on a Mac? It seems like I should be able to either:

A) Use SoftPC and run the Grove software (yuch)
B) Export the dBase compatible files for use with a Mac database program (MS Works, FileMaker Pro, etc)

Any help or words of encouragement would be appreciated!

-ksmith, KD6RCT

I use one. It's worth $30. I use it both for swl and scanning. A VAR
is most effective, however, while scanning. It can compress a whole
evening's activities onto one side of a 60-min tape. VARing does not buy
you much during SWLing unless you use the receiver's timer or equivalent
devices.

IMHO.

--Well,other than both being made by Icom,they dont realty compare.the 100 is
a small mobile\base AM\FM scanner that is a decent but not spectacular
performer.The 7100 is a very high grade 1000 memory(I think)communications
reciever that is an excellent performer.It recieves ssb as well as AM\FM modes.
If you can possibly swing it,go for the 7100.You wont regret it.

Hi, Folks...
I have a Bearcat 210 XL that has a problem. The unit has a blank display, though the squelch still works. Slowly, the display will come to life. Sometimes, it will power up all the way and the display will be normal and will pick up radio signals. When the display is black or dim, then no signals can be received. Can anyone help? Please reply here or via Internet.
Internet ID 73747.2143@compuserve.com or jerry.smith@chigate.com

Thanks...
Jerry...Chicago

192. HB-232 Questions/Comments

Newsgroup: rec.radio.scanner
Date: 1994-01-10 11:20:02 UTC
From: hpeach@ca.uky.edu
Message-ID: <hpeach.43.000B55CF@ca.uky.edu>
Source record: 277996

I recently completed assembly of Comtronics' HB-232 computer interface for the Radio Shack PRO-2004. The unit works as advertised and, while the kit is not for beginners, assembly went pretty well with lots of documentation and FAX/on-line support available if problems occur.

Now for some questions:

Does anyone have a diagram for using a reed relay with one of the user switches? I am trying to activate the remote switch on my tape recorder. The circuit seemed simple enough, but I am getting a small voltage across the relay's terminals when open.

Has anyone purchase the Sherlock program? How does it do? I am interested in how the program records the frequency information on the tape along with the audio without using additional hardware.

Are there any freeware/shareware programs for the HB-232 available for FTP?

Harold

Source record: 277995

Does anyone know if ice-laden trees pretty much kill VHF signal propagation? We just got hit with one of the worst ice storms in ages in Central Jersey, and my car bound PRO2025 suddenly went deaf.

I couldn't even pick up NOAA (where I usually hear _three_ transmitters!), which I use to check my antenna connection. Sure enough, as the ice started to melt and fall off the trees, overhead wires, and signs, my reception started to come back.

Being in a moderately wooded area, the roads began to feel like an ice cave with what were once tall trees now arching over the roadway in perfect semicircles.

|> Thanks in advance for any information.

I have the same Pro2006/Diamond D130/RG213 setup. I
placed a 20db amp on the antenna feed and got inferior
reception that improved when the 10db attenuator switch was
enabled. I believe this is due to receiver
desensitization. My suggestion is that you first try
whatever amp you buy with the option of returning it if
reception is not improved. The same amp does provide
better reception when used with my Yaseu FT530 handheld. I
measured a 2x change on the handheld S meter and observed a
less noisy audio on signals which were fringe.

happy listening,
Peter

196. Antenna Questions

Newsgroup: rec.radio.scanner
Date: 1994-01-10 16:18:10 UTC
From: david.clark@analog.com
Message-ID: <1994Jan10.161810.19838@analog.com>
Source record: 278004

I have a couple of questions about an antenna to mount on the roof
for my RS PRO-39.
First of all, has anyone ever used the RS Discone antenna. They
claim freqs. from 25-1300 MHZ? Is this true and how well does it
work? Or is there a better antenna available for less than $100
somewhere other than Radio Shack?
Second, is it possible to hook-up the same antenna to two different
scanners? I would like to just split the coax instead of putting
a switch on it. Would this affect the performance of the antenna
or scanners?
How much more range would a discone give the scanner? I used to
pick-up Boston Police Area D and now I get some of the freqs, but
I have to move the scanner around. So, I'm assuming it's the antenna
on the scanner, as I can get my town police and Public Works no prob.

Please post or E-mail responses. Thanks in advance!!

Dave

>

Radio Shack is fine unless you can find another convenient place that
sells Antenna Specialist products (A.S. has a wider selection of
antennas). You will probably want a magnetic mount antenna unless
you feel like drilling a hole in your car. The best place to mount
the antenna is somewhere that there will be a ground plane, like the
center of your roof or trunk (although the ground plane is not that
critical for scanner antennas). You can really mount it where ever
is most convenient.
As far as damage is concerned, you might get a variety of responses
to this. Most MAG mount antennas will not damage your car (paint job)
but you might get some minor scratches where the cable runs accross
your car. The wind vibrates tha cable when you drive and it tends
to scuff the paint slightly. A good wax or rubbing compound can be used
to polosh the scratches out.
Also, caution should be taken not to crush the coax where it feeds into
car. The center conductor of the cable can be damaged from repeated
door closures.

Hope this helps

198. Yupitero MVT-7100

Newsgroup: rec.radio.scanner
Date: 1994-01-10 17:00:33 UTC
From: grant@fallout.lonestar.org
Message-ID: <1994Jan10.110033.11931@fallout.lonestar.org>
Source record: 278009

The October issue of Monitoring Times contained a glowing write-up on the Yupitero MVT-7100 handheld scanner. It is a 1000 channel, triple conversion scanner covering 530 kHz to ~1600 MHz in AM, NFM, WFM, USB and LSB. The scanner is hard to come by in the USA because it is not FCC approved. It can be ordered from some British mail order houses.

Does anyone have any experience with this scanner? If so, is it worth the fairly high price (~$600). It evidently does not provide a 30 kHz scan increment. Does it allow you to use a 10 kHz increment in the 800 MHz range (which would let you scan freqs with 30 kHz spacing)?

Thanks,
David Grant

IF you mean the Icom R-7000 (base receiver), then $1000 is a fair price
for a NEW one. Used should be a few hundred less. It is a fine receiver
and about as good as they come. To fully realize its potential as a
SCANNER, you will want a computer control program. The R-7000 is
designed more as a communications receiver than a scanner. For example
it does not have a 2-second delay for scan resume like most scanners.
A control program can turn it into the best scanner available.

I bought the WI disk (USA comes as a bonus) and even though it is a
"standard"
DB4 PC database format, couldn't do much on my Mac.

However, I didn't know the size or that Excel was limited to 32K records.

Wisconsin contains 53K records.

I got a "PC" person to fire up the database and dump the data to a flat
file
and then loaded the data in to FileMaker Pro via the net (10 to 13 MB's of
data depending on your sort criteria for some reason!!)

Works quite well for searches - but you don't want to sort very often.

Very pleased with results.

Paul

Yes, ice on the antenna and surrounding area will attenuate signals.
Water makes surfaces more conductive, and in the case of trees, roofs,
etc. it makes them look like big grounded areas, and signals will
not pass through them.

Here are a couple of guesses based on similarity of circuits of Satellit 500 and 700.
It seems to me that the rumble, if it is present also when operating off the batteries, has to do with the design of the PLL of the synthesizer. I have no idea how one could cure this.

If the excessive distortion is present only at low frequencies, then it might be caused by audio frequency feedback to the synthesizer via +3.5 V, and a large capacitor (> 2000 uF) across this voltage could help a little. One will need a signal generator and an oscilloscope to find out if this is the case.
If there was a detector biasing problem, the distortion would be strongest in the SSB mode with no carrier.
Good luck!

Ylo Mets.

I've never heard of an RU-7000, but the R-7000 is a great receiver. You
can tune any freq you want without preprogramming, so it's not a scanner.
I've seen them used for as little as $650, so $1000 is too high. AES has
had a used one with a remote control and a voice synth for $900 for a few
weeks now.

The RS discone is an OK antenna, but it does not perform well below
about 100Mhz. As far as omnidirectional antennas go, The Diamond
discone has an additional vertical element that improves the low freq
range. There is also one called a ScannerMaster (?) but it is larger
than a discone. Grove sells a copy of this and claim it is at least
as good. If you want a directional antenna (use with a rotor), then
cheak out Grove's scanner beam. At about $60 (?) it is a good deal.

If you hook up two scanners into on antenna, then each scanner will
receive 1/2 of the signal (approx), not to mention any loss introduced
by the splitter. If you do this I would suggest a pre-amp. It is possible
that internally generated signals might leak from one scanner to the other,
but this probably would not be a problem.

A roof antenna should make scratchy signals clear and extend your range
significantly (but this depends a lot on the topology of your area). Be
sure to use a low loss coax for any runs longer than 30 - 50 feet (depending
on the frequency ranges you listen to. (i.e. 800 Mhz siganls lose
strength quickly with lossy coax)

: ...

I knew my numbers were wrong when I did my very unscientific test. I used a stopwatch and a meter! Sorry... The problem is that the needle of the meter must have a lag or maybe I reversed the fraction - maybe it's a 15% duty cycle. Certainly it does what it's supposed to do (only who listens to just *one* channel?!). Now that I've had the pro 43 longer, I really have to admit that I like the Pro 39 better. It consumes way way less power, has an easier-to-read display, sounds twice as good, is cheaper, and mine gets *less* interference when scanning pre-programmed channels. Too bad Grove doesn't sell the Pro 39 - anyone know of discounts? How much longer will they be available?

My $0.02 is that Damark has factory serviced, warranted BC200XLT units
for 159.95. I recently sold mine (paid $210 for a used one) and
upgraded to a PRO-2006 (which is *very* nice, and surprisingly similar
in function). I highly recommend the BC200XLT, my first scanner was a
serviced BC100XLT from DAMARK and it worked flawlessly. For $160, the
200XLT has NO EQUAL. I got a crystal from someone via the net that
doubled the scan rate, it put it at about 30 ch/sec, which is faster
than any other rate I have seen short of the BC2500XLT. I had
considered upgrading to a 2500xlt but unfortunately it seems to have
too many problems to be worthy of consideration.

Bob Parnass, AJ9S (parnass@cbnewse.cb.att.com) wrote:

212. BC100XL repeated frequencies

Newsgroup: rec.radio.scanner
Date: 1994-01-11 04:19:30 UTC
From: dbaaij@devetir.qld.gov.au
Message-ID: <dbaaij.758261970@pandora>
Source record: 278017

I recently bought my first scanner second-hand, a Uniden BC100XL and I proceeded to try and locate various interesting frequencies. I found a number of local police frequencies which were quite clear, but I got hold of a complete list of frequencies for my state and it has the police frequencies listed differently to the ones I found.

I tried the listed frequencies and found that they were the same channels(I think). eg. 490.000 = 468.400
490.100 = 468.500

I compared these 490Mhz freqs on a friend's PRO-30 and he received nothing on them, but he received the listed frequencies.

What is this? Is it a problem with the BC100XL? Are other problems likely to pop up?

Any advice appreciated.

>The October issue of Monitoring Times contained a glowing write-up on the
>Yupitero MVT-7100 handheld scanner. It is a 1000 channel, triple
conversion scanner covering 530 kHz to ~1600 MHz in AM, NFM, WFM, USB and
>LSB. The scanner is hard to come by in the USA because it is not FCC
approved.

I have one and really like it. Yes, after April 1994, you won't be able to
import.

>It can be ordered from some British mail order houses.

I ordered mine from Janathan Clough at Javiation in England...excellent
service. I highly recommend. Most of the CI$ people ordered from his also.

>If so, is it worth the fairly high price (~$600).

It depends, I think so. Look at it like this: You get a VHF/UHF scanner,
shortwave radio that rivals most portables, plus no gaps ANYWHERE.

>It evidently does not provide a 30 kHz scan increment. Does it allow you
>to use a 10 kHz increment in the 800 MHz range (which would let you scan
freqs with 30 kHz spacing)?

Yes, the 10 MHz spacing works just fine in the 800 Mhz range.

Marks against the radio: 1.4 KHz off in the USB, LSB modes, is a little
power hungry.

John Morrison <John.Morrison@f239.n109.z1.fidonet.org> writes:

>Have you gotten the M400 to successfully decode POCSAG and GOLAY pager
>messages?

PMJI, but I've successfully decoded POCSAG and GOLAY messages with my M-400. It wasn't easy to get started, because I discovered that you almost have to tap off of the demodulator in your scanner to get the audio before it goes through audio filtering. The audio gain adjustment is also very critical. You need to follow their addendum instructions exactly to set a proper level. A little trial and error will also help you set it up properly.

Sorry, Mike, but the 210XL doesn't have an RF section for the 800 MHz band, so it can't be modified for cellular reception. The 210XL was designed to just receive the standart Public Service Bands (at least those that existed when it was built).

> converting the data for use on a Mac?

I converted the 5 1/4" PC floppy to a 3 1/2" PC floppy, copied the dBase file from the 3 1/2" disk onto my Mac via AccessPC (it reads DOS disks on a Mac floppy drive),. Then I wrote a program to read the dBase binary file (simple format - widely documented in the literature) to output a text file. I'd consider providing a copy the conversion program if you email me - no warranty of usability, though.

My preferred database for frequency lists is Panorama. It's a flat file data base that keeps everything in memory - so it is very zippy. It sorts all 32,000 records in the Oregon FCC list in just a few seconds on my PowerBook (by frequency, by licensee, etc.). If it only supported AppleEvents, I could lookup the FCC data whenever the computer interface to my radio is tuned to a station! I've recently started using FileMaker Pro for just that purpose.

bmiller@landesk.intel.com (Brett Miller - Support Engineer) writes:
: As far as damage is concerned, you might get a variety of responses
: to this. Most MAG mount antennas will not damage your car (paint job)
: but you might get some minor scratches where the cable runs accross
: your car. The wind vibrates tha cable when you drive and it tends
: to scuff the paint slightly. A good wax or rubbing compound can be used
: to polosh the scratches out.

Wax protects the paint, so it doesn't get scratched in the first place.

: Also, caution should be taken not to crush the coax where it feeds into
: car. The center conductor of the cable can be damaged from repeated
: door closures.

Damaging the center conductor is not the problem. Crushing the insulator
between the center conductor and the shield is. It changes the impedance
of the coax at that point, causing some signal loss. If the insulation
is completely crushed, then the shield can short to the center conductor,
and you will have very little signal.

The impedance discontinuity does not matter a lot in a receiver. It can
make a big difference in a transmitter.

:
: I compared these 490Mhz freqs on a friend's PRO-30 and he received
: nothing on them, but he received the listed frequencies.
:
: What is this? Is it a problem with the BC100XL? Are other problems
: likely to pop up?

You are receiving image signals. It is one of the problems inherent in
single and double conversion receivers.

It looks like your 2nd IF is at 10.8 MHz - normal for more recent
Bearcat scanners. Note that 2 x 10.8 + 468.4 = 490.

Many people make use of this "feature" of such scanners to receive strong
cellular phone transmissions, when their scanner does not cover the channels
directly.

To tune in the out of band frequency - subtract (or add - whichever is
appropriate) 21.6 MHz from/to the frequency. That is the frequency you
will listen to on the scanner. In other words, if your scanner will
cover the frequencies - then you could find your two example channels
at 511.6 and 511.7 MHz.

Source record: 277875
Cross-posted to: rec.radio.scanner,alt.radio.scanner

The "loss" of said diode is not critical. By removing it, you have enabled cell reception. Try doing a search between 869 (comes up at 868.xxx) and 895 (comes up (I think) as 894.xxx). You should be able to scan and receive these freqs. If you look on the back bottom of scanner, it shows what freqs it is "supposed to receive". Notice that the freqs above are "outside" of the posted ranges.

Putting the diode in position d3 (next to the other diodes) opens up freqs 54 thru 88.

I have made the mod to mine. Works great. As to 54-88, doesnt seem to be much there, so don't worry too much about "damaged" diode.

Perhaps if you got the tech manual from RS for it (the pro43) you could find out the needed part number/availability. I think RS sells it for about $10 or so. Try looking around here or in rec.radio.scanner. I think someone posted the 800 number for ordering RS manuals.

Rey asked about the Regency K500. I cannot provide you with
manuals, but here's some info:

K500: Nice wood-like cabinet. Discontinued 40 channel model
with every feature Regency could dream of in one scanner,
except aircraft band. Idle tone bypass feature for mobile
phone stations works about 50% of the time. Weather alert
feature. Service Search in several banks. Search and Store
facility not implemented as well as BC250, but better than
none. Built in clock when radio off or in manual mode. Can
be programmed out of band. Reasonable performance, but sen-
sitivity could be better. Spring contacts on membrane key-
board may need soldering after prolonged use.

My K500 served well for several years, but now sits on the shelf,
with an intermittant problem I haven't yet fixed.
I added a tape recorder control jack on the rear and built in
a carrier operated relay...several years before I got VOX recorders.

Oh goody - someone who can provide some real answers!

I assume that this unit does a good job of picking up regular FM
broadcast stations and VHF/UHF television stations. How well does
it do at picking up regular AM broadcast stations with the duckie
antenna that comes with it (e.g., is it on par with a Walkman)?

Does it take ordinary batteries so that if I had a good battery/
recharger setup I could run it off batteries as long as I liked
(more or less)?

From: cm002b@uhura.cc.rochester.edu
Message-ID: <1994Jan11.165606.17182@galileo.cc.rochester.edu>
Source record: 277880

Hi Y'all. I'm planning to purchase a pair of CB radios in the next couple of months, but I have no Idea what to look for in terms of features or manufacturer. I'd like them to look decent when they're installed in my car (ie no Ratshack chrome jobs), and I'd like them to be relatively small. Is there any good CB out there that has all the controls mounted on the handset so I can put the rest out of sight? Also, what is the best antenna mounting option? I don't want to do anything I'll regret to my cars ('93 Saturn SC2 and '91 Ford SHO). Are the AM/FM/CB antennas any good? Lastly, where's a good place to shop for them (retail or mail order)?
Thank you very much.
Chris

Source record: 277882

The Yupiteru MVT-7100 will readily pick up standard FM stations.
I haven't tried DXing that, but it appears to be as good as any typical
FM radio. No trouble picking up TV audio signals for TV receivable stations
in this area. It does fall short in the standard AM bandwidth. During the day
I can receive the local stations, but it's almost a struggle. After dark,
you can get only those local stations that don't reduce power. DXing, forget
it. This is with the supplied telescoping metal
antenna. Presumably, you could also receive LW broadcasts, as you can enter
frequencies as low as 100Khz. That said, I woudn't want to see the low end of the freqency
spectrum
dropped, merely improved sensitivity wise, if possible. But then, we typically
don't buy a scanner for this part of the spectrum, and this is not a complaint
on my part.

It appears to be a good deal more sensitive than my BC200. 10Khz steps work
on bands where 30Khz steps are more desirable.

Batteries appear to be standard AA NiCads. Following previously posted
instructions, I bought a RS 12v adaptor and installed the small barrel
connector the 7100 requires. I use this instead of the supplied adaptor as
that is designed for 100VAC.

I bought mine from Javiation and would like to second that they have great
service. I probably received the first defective unit they've encountered
and was, with a minimum of hassle, able to get a replacement unit. My present
unit is so far working very well.

This is a *great* scanner if you want to/can shell out the bucks for it. Too
bad wonderful hardware like this will soon be illegal to get.

Hello,
This is the first time Ive posted to this newsgroup.
I recieved an AR-1500 for Christmas. I was wondering how this
stacks up to other handheld scanners. So far I have been pleased
with its reception but since Im new to scanning (and shortwave)
I have nothing to compare it to. Also I was wondering if there
are is any way to fix/change any of the following:
1. turn off the button beep.
2. change the scan/search speed. (right now around 20ch/s)
3. when you push the minitor button the channel spacing
is always 12.5khz, since I use this feature mostly on shortwave
is there any way to change this default to say 5khz??

Also how does this stack up to the Yupitera (I think it is.)
I might want to exchange this for one of those, if there that much
better...although $150 dollars more.

thanks in advance,

I've been trying to use a voice-activated recorder for SWLing, too. The biggest problem I have with this is I can never tell which of a number of frequencies or which setting of the controls will bring the signal in best when using the timer. So, sometimes the timer can go off but the signal will suck for unattended recording. Doesn't seem to be a good work around for this problem.

Dumb question, but what is a frequency counter?

From what I've heard, it lets you determine the frequency at which something is transmitting, but how? Does it just pop the number up, or is there more to it than that? thanx!

239. Re: Antenna's for listening to 46.8 Mhz

I want to add an antenna to my car to improve reception in
the 46.5-47 mhz range. (DUH! I wonder why? =)) A couple
people have posted advice here, so I'll just post my questions
here:

Someone said:

> I have two receiving antennae on my car, one of them is a generic
> multi-band antenna that boasts coverage from 30Mhz-1Ghz, and the other is
> the 8.6ft Fiberglass whip that RS sells, cut off at exactly 5 feet.

> For 46-49 Mhz the 5' modified fiberglass whip outperformes the multi-band
> antenna by a long shot. It also picks up the aircraft band (118-136)
> really well, even though it's off freq. for it. I have the 5' antenna

So does this mean I just go to RS and buy an 8.6 foot Fiberglass whip,
and clip it (with gardening tools) to 5 feet?

Now, somone else said that the antennal will have a coax cable attached
to it. Is this true for this whip as well? Is it long enough to
reach inside the car?

Also, I apparently need a UHF to BNC adaptor if the connector
is not a BNC adapter.

I'll also need the magnet to attach it to the car (or some way of
attaching it). Where do I get this from?

All in all, how much will it cost? How much for the whip, the
cable (if not included), the adaptor?

Someone else said:

> I live in an area that has heavy low band use. My area Police and fire are
> at 39Mhz, and State Police still use 42-44Mhz. I cut a RS CB stainless
> whip to 70 inches to produce a broad band quarter wave. It outperforms
> anything (on these bands) that I have ever used.

So which one is better? What should I cut to? 5 feet or 70
inches?

Thanx for your help. I'd love to hear from someone who's actually
done this. ttul!

240. PennDOT frequencies?

Anyone have a definitive answer on frequencies used by the
Pennsylvania Department of Transportation (PennDOT)?

I've checked a couple of different sources and come up with
a dozen different answers. Theories included having the state
frequenmcies varied by east/west or by engineering district,
as well as by county.

I asked my contact at a local PennDOT office who at first fired
off a list of three frequencies, but then added "I think these
might have been changed recently, I'm not sure...."

All of the answers so far have been in the mid-47 MHZ range.
The most popular answers are 47.14, 47.30, and 47.38...

Anybody know for sure? - Dave

For receiving ~46 MHz in the car (which does not just mean cordless phones; the California Highway Patrol live near there most of the time), I've found that the car's regular radio antenna works just as well, other things being equal, as a mag-mount scanner antenna. An FM radio antenna is a quarter wavelength at the center of the FM band, which means it's half a wavelength at 49 MHz, which isn't bad at all. (Certainly it's a lot better tuned than a 27 MHz CB antenna used at 46 MHz!) It's easy and cheap to try; Radio Shack even has an adapter to go between the antenna's "Motorola" antenna plug and a scanner's BNC jack.

DON'T try splitting the signal and feeding to both radios at once, you'll get just what you should expect -- half of the signal goes to each.

The "other things being equal" part is the trick. The radio antenna is usually on a fender, with coax of dubious quality, perhaps running longish distances to get to the dash.

The other big "inequality" suffered by the FM antenna is its placement: It's usually in a very asymmetrical position wrt the car body, and it's usually down on the fender too. A mag-mount scanner antenna smack dab in the center of the roof is absolutely ideal as far as height and symmetry are concerned.

But back to the FM antenna: For a real stealth installation, put the scanner in the trunk near the antenna... (well, MY car's antenna is on a rear fender, dunno about yours); use a coax relay to switch the antenna to the scanner or to the in-dash radio; run audio and some remote control leads from the scanner into the stereo head unit. A really serious, read deranged, scannist would use a scanner with a computer control interface and an HP or similar palmtop up front to control it.

I was going to post this a while ago, but I wasn't sure it would do anyone any good. But, for what it's worth, I was in Hong Kong a few months ago and saw the Yupiteru in a store in Tsim Sha Tsui (main shopping district). I asked how much they wanted for it and they said US$450!!

As with all shopping in Hong Kong it is buyer beware. I would not reccoment trying to mail order this, but if you are in the neighborhood.

I think the store was on Hanoi Rd. If you are serious about going there I can provide the info off the business card I picked up.

The only reason I didn't buy one was because it was larger than I wanted.

244. Mobile Scanner with Alphanumerics?

Newsgroup: rec.radio.scanner
Date: 1994-01-12 00:07:01 UTC
From: mccormac@galaxy.mpr.ca
Message-ID: <1994Jan12.000701.9437@mprgate.mpr.ca>
Source record: 277896

Hi all,

I am in the market for a mobile scanner that will be permanently installed in my car. I have uncovered many *mobile* scanners, however, most of them are not appropriate for in-dash installations such as any normal car radio/tape/cd player. Another feature I really must have is an alphanumeric display. It is just as important to me to be able to identify (at a glance) who is broadcasting as it is to hear what they are saying.

I have considered the new Uniden 8000 model (don't recall the exact model number off hand) but it was mobile compatible and had many nice features. However, unless I can find a way to remote mount a control/display panel, I doubt I will consider it due to its immense size (The unit I buy must roughly fit in a DIN sized dash space). The only other mobile unit I know about is the aging Kenwood RZ-1, which is exactly DIN sized and has 100 memories with alphanumeric capability. Unfortunately, not only is it old, but overpriced, and I have heard that its scanning abilities are marginal.

My questions to the group include:

[1] Are there any other alternatives to the RZ-1 or 8000 for mobile scanners that are roughly DIN sized and have alphanumeric displays?

[2] What is the possibility of crafting a custom display and control panel for the Uniden model given a fair amount of personal electronics experience?

[3] What are the pros/cons of the Kenwood RZ-1 receiver?

[4] Does anyone else make a scanner with alphanumerics regardless of its intended application?

Thanks very kindly in advance,

Chris McCormack (mccormac@galaxy.mpr.ca)

If AOR had done their homework when re-designing the AR1000 to fit into the old AR900 case, they would have come up with something like the Yupiteru. The Yupiteru MVT-7100 is the AR-1500 done =RIGHT=.

>I might want to exchange this for one of those, if there that much
>better...although $150 dollars more.

Do it. Absolutely. Here is my friend Howard Bornstein's review:

:
PRODUCT REVIEW

AOR AR1500 continuous coverage handheld scanning receiver with SSB.

by
Howard Bornstein
Copyright 1/25/93

This is a review of the new AR1500 continuous coverage handheld scanner from AOR. Consider this review to be preliminary, since it was conducted on a unit I had available over a weekend and does not reflect long-term usage. In this review, I will be comparing the AR1500 to the AR1000 and the Radio Shack PRO-43, two other scanners I am very familiar with (I am the author of the Guide to the AR1000, and the upcoming Guide to the PRO-43).

VERSIONS
There are three versions of the AR1500 known at this time. The original AR1500 was released and available in Japan, the UK, and Europe in mid 1992 and was known simply as the AR1500. A later revision to this scanner appeared in late 1992, called the AR1500E. This model differs from the earlier model by including a cascade filter at 58.075 MHz IF to improve selectivity, a DC input protection diode to guard against reverse polarity connection, additional buffering in the microprocessor to protect against software crashes when scanning an empty bank, and a reset switch in the battery compartment.

A new revision, called the AR1500EX, will be available on Feb. 9, 1993 only in the UK. It contains a substantial redesign of the PC boards and logic circuits. The RF board has been completely redone. In addition, the BNC connector has been reinforced. The unit is supposed to have better selectivity and better handling of strong signals.

This review was conducted on an AR1500E that was imported in the US from ACE Communications. My thanks go to Glenn Cohen of Scanner's Unlimited for the loan of this unit for testing.

FEATURES
The AR1500 is a very feature-laden scanning receiver. It's main features are:

o 900 general channels of non-volatile scan memory. (100 channels dedicated for search and store feature).
o 10 individual search banks. (Bank 9 dedicated to search and store)
o Reception in FM, wide FM, and AM modes.
o Contains a beat frequency oscillator (BFO) for reception of single side-band (SSB) and continuous wave (CW or Morse) signals. It can receive both upper side-band (USB) and lower side-band (LSB) transmissions.
o Continuous coverage from 500 KHz to 1300 MHz with no gaps.
o Searches and scans at 20 channels per second.
o Any channel can be the priority channel which is active in search, scan, or manual mode.
o Search increment is user-selectable in any steps of 5 KHz and 12.5 KHz up to 995 KHz.
o Tuning knob.
o Channels, scan banks, and search banks may be locked out. Also, individual frequencies during a search may be locked out.
o 10 db attenuation switch
o Automatic search and store function.
o Delay or Hold feature.

SIZE
The AR1500 is a fairly small scanner, much smaller than the AR1000 and about the same size as the PRO-43. It is about 1/2 inch taller than the AR900. Both the buttons and the display are smaller than the AR1000, as is the speaker.

There is a trend with current scanners to make them smaller, but there seems to be diminishing returns in this endeavor. The AR1500 is small enough to be a problem for some people. For someone with large hands, the small buttons may create difficulties in programming. There are also many controls crammed on the top of the scanner (see below). In particular, it is quite difficult to turn the unit on and off and adjust the volume because the On/Off/volume knob is crammed in between the BNC connector and the Squelch/BFO knob. This makes if very difficult to get your fingers around the On/Off knob to turn it.

Other negative side-effects of the small size are the smaller, lower-fidelity speaker, and the smaller battery pack, reducing operation time.

CONTROLS
The top of the unit contains a number of knobs and switches. You'll find the BNC connector, an On/Off/Volume knob, a ganged BFO/Squelch knob, a tuning knob, a BFO button, a 10 db attenuator button, and earphone jack, and a pushbutton switch for keylock.

The display and the keyboard are the same as the AR1000, although some of the keys are in different positions (e.g. BANK and INC are reversed on the AR1500 and INC is now called STEP).

Sound quality is good and the unit can be turned to full volume without distortion, but the speaker doesn't give the same high-fidelity sound as is found on the AR1000.

ACCESSORIES
The AR1500 in the US comes with its built-in nicad pack, a AAA battery holder, a rubber ducky antenna, a 5 meter wire antenna with a BNC connector on one end for HF reception, a cigarette lighter adapter, and AC charger, a soft case and a single ear earphone.

Note that the AC charger is not designed to operate the unit but to simply charge the batteries while the unit is turned off. If you want to use the scanner while plugged in (which you will, since the battery life is short), you will have to purchase a separate AC adaptor. The Radio Shack 12 VDC 500 mA adapter (CAT No. 273-1652B) works fine for this.

OPERATION
The AR1500 operates essentially the same as the AR1000. This is to say that it uses a somewhat cumbersome programming scheme. Users of the Uniden BearCat series of scanners and the Radio Shack/GRE PRO series of scanners will find the AR1500 operations to be tedious.

Of more concern is that the operation of the AR1500 was modified slightly--in some cases to handle the new search and store feature and in others to simply "improve" the operations. However, many of the special tricks and shortcuts that were possible on the AR1000 (and described in the Guide to the AR1000) no longer work on the AR1500. While learning how to use the AR1500 is not all that difficult, it requires more time than most scanners and more consultation with the user documentation.

An interesting difference between the AR1500 and the AR1000 is that every keystroke you enter on the AR1500 generates an audible beep for feedback. This capability is also found on some of the Fairmate versions of the AR1000 (i.e. the HP100 and HP200). On the AR1000, there is no keystroke beep.

USER'S MANUAL
The AR1500, as supplied in the United States, comes with a 19 page user's manual. This manual briefly describes the keys, the controls, and the basic operations, but doesn't go into much detail about how to take advantage of the power of this scanner. In addition, there are some serious errors in the documentation, particularly in the examples. As stated above, the Guide to the AR1000, while covering all the basic operations of the AR1500 (minus the BFO and search and store feature), addresses many tricks and shortcuts that are not applicable to the AR1500. As a result, the Guide to the AR1000 is not primarily recommended to owners of the AR1500.

The user's manual for the AR1500 available in Australia and New Zealand is better and the manual produced by AOR Ltd. in the UK is the best.

PERFORMANCE
The following characteristics are based on my subjective analysis during usage and not on laboratory tests. They may be specific to my location (San Francisco Bay area).

SENSITIVITY
The AR1500 is a quite sensitive receiver. It proved to be more sensitive than the AR1000 but less sensitive than the PRO-43. It easily broke squelch on a signal that the AR1000 could only hear with the squelch opened manually. Both units were using identical DA900 rubber duckies.

Like the AR1000, the AR1500 can pick up SW and MW signals when attached to an appropriate long-wire antenna. While you wouldn't buy this unit as your primary shortwave receiver, it can pick up strong SW signals nicely (subject to signal fading) and the AR1500 can easily decode SSB signals.

INTERMODULATION
The AR1500 seems to have about the same intermod problems as the AR1000. My unit got periodic FM radio broadcast interference all across its frequency range. While it wasn't as bad as the Icom R1 is rumored to be, it was noticeable.

IMAGES
The AR1500 is supposed to be triple-converted, but I noticed images in the 800 MHz range. I picked up cellular phone conversations on the local government frequency of 812.2125 MHz. This was the only frequency I noticed images on. The AR1000 doesn't do this.

RF
The AR1500 puts out a fair amount of RFI. It stopped the PRO-43 from scanning at a distance of over 4 feet. If you are using this scanner near other scanners, you might have a problem.

BATTERY LIFE
The AR1500 comes with a custom 5 AA cell molded nicad pack. The pack is removable, but there is no way to charge the pack while out of the scanner. The scanner also comes with a battery holder that will take 4 AAA alkaline or nicad batteries. I wasn't able to do a battery test on this unit but the custom nicad pack battery life is said to be about 4 hours. The AAA battery pack life is supposed to only be about 2 hours. Any AR1500 users who have more accurate figures than this are encouraged to contact me and I will update this document to reflect these figures.

Charging time is approximately 15 hours and you are warned not to overcharge the nicad pack.

Battery life and maintenance seems to be the biggest problems with this unit. It will not be very useful in the field if you run out of juice in a few hours. And, unfortunately, you can't be charging one pack while you are using another.

SSB OPERATIONS
One of the more intriguing features of the AR1500 is the ability to decode

SSB. The AR1500 includes a BFO that you can use to tune in upper or lower side-band signals. There are a number of limitations to this feature, however.

I had hoped that you could simply program in a number of utility stations and scan them in SSB. However there are a couple of things that make this impossible. First, the squelch control on the AR1500 is as squirrelly as it is on the AR1000. The squelch setting is different for different bands, and in the SW region it is practically useless. You cannot squelch out many frequencies, even if they don't appear to have an active signal or carrier. Therefore, you can't really scan these frequencies.

The second problem has to do with the resolution of the AR1500. The finest tuning increment you can select is 5 KHz. You use the BFO to tune between the 5 KHz limitations. So, for example, if you wanted to pick up 8989 KHz, you would have to enter 8990 and then tune down to 8989 with the BFO. Of course, the setting on the BFO would be different for this station than it would for 7613 (you'd have to enter 7610 or 7615 and tune in between with the BFO). What this means is even if you could scan SW stations, the BFO would be set at a different location for each station.

While I didn't try this with CB, presumably you could enter all 40 CB channels, set the BFO to USB and scan all the USB CB channels. Then, just by turning the BFO a bit, you could scan all the LSB CB channels. If any AR1500 user can confirm this, please drop me email and I'll update this document with your comments.

The unit I tested also put out an extremely high-pitched whine while tuning in the SW bands.

SEARCH AND STORE
The search and store feature provides a way to automatically take active channels that you find during a search and plug them into scan channels. The search and store feature on the AR1500 is pretty limited in its capability and usefulness. This is somewhat frustrating, especially since all of the capabilities are built into the AR1500 to have made this a much more useful feature.

Whenever you search with search bank 9, every channel it stops on is automatically plugged into the next succeeding scan channel in scan bank 9. The first signal goes into channel 900, then 901, etc until you fill up all 100 channels in scan bank 9. When you reach channel 999, the unit starts over with channel 900 again.

The way you would use this is to start searching and then later simply scan, using scan bank 9. The problem with this feature in the AR1500 is that it stores anything it stops on during a search. It will store open carriers, data channels, static, and any other kind of signals. The biggest problem, however, is that it stores the same frequencies over and over again.

This could have been eliminated and the search and store feature could have been made to be much more useful had AOR simply combined the search frequency lockout feature with the search and store feature. This way, as

soon as the scanner stopped on an active frequency during a search, the frequency would be stored in scan bank 9 and be locked out of search bank 9. Then, an active frequency would only be stored once. In addition, the scanner wouldn't have to needlessly stop on channels you have already stored, making it more likely that you could catch the elusive signals in the range you are searching. Then, when you scan bank 9, you'd get all the frequencies found during your search with no repetition. Alas, it wasn't implemented this way, so IMHO the search and store feature is quite a bit less useful.

In addition, the search and store feature only stores the mode as AM or FM. If you are searching in WFM mode, the channels get stored as FM mode, not WFM mode.

RECOMMENDATION
The AR1500 is an amazing piece of engineering, cramming incredible functionality into a very small package. Unfortunately, the small size itself may be more of a minus than a plus. It makes the unit harder to operate and gives it a considerably shorter battery life. In addition, the designers of the AR1500 didn't fix many of the idiosyncratic problems of the AR1000 when they designed this new scanner.

While the AR1500 is more sensitive than the AR1000, you lose 100 scan channels and one search bank to the dedicated function of the auto search and store--a feature which may not be of great value to most users.

You also get SSB reception, but this feature generally can't be used in scanning mode. This makes SSB reception a single station feature. Since the AR1500 isn't designed as a primary shortwave receiver, this feature should be considered a bonus, not a main selling point.

Unless you have a specific and demanding need for SSB reception, it seems hard to justify the additional expense of an AR1500 over an AR1000, especially considering its difficulty of operation due to its small size and its short battery life. However, if you are in the US and are buying the AR1500 from the UK, with the current exchange rate, you may get a price comparable to the US version of the AR1000. In this case, the trade-offs might make sense.

The AR1500 has the same intermod and squelch adjustment problems as the AR1000. In fact, the AR1500 manual from ACE carries this disclaimer in the warranty:

"We do not warrant that the operation of the unit will be uninterrupted or error free."

BOTTOM LINE:
If you want a continuous coverage scanner and don't have a pressing need for SSB reception, buy an AR1000.

Feel free to contact me with comments, confirmations, criticisms, or additional information (I'd appreciate holding off on the death threats if you don't mind!)

While we're at it, here are the freqs that I have so far for Montreal
Dorval Airport:

118.900 Arrival
119.900 Tower
121.900 Ground
122.500 Tower (again?)
122.600 Transport Canada
124.650 Departure
125.150 Arrival
125.400 VFR
126.900 SELCAL
127.900 SELCAL
130.375 Air Canada & Ontario
130.575 Canadien Airlines Int'l (Dorval maintenance)
132.350 Tower
132.575 Canadien Airlines Int'l (Dorval ops)
134.150 Arrival/Departure
135.050 Air Canada
135.400 Air Canada
167.850 Air Canada ramp
460.700 Air Canada ramp

I have only monitored a handful of the "company" channels listed above
from my QTH in Rochester, NY. The rest are compiled from various sources and
are unverified.

In particular, I question the "SELCAL" frequencies, as they are outside
the range generally occupied by ARINC stations. Neither do I know just what
"VFR" is supposed to mean. The multiple Arrival, Departure and Tower listings
are probably split up geographically. Any help in correcting or amplifying
the above info will be greatly appreciated.

Here are freqs on which I have heard aircraft working Montreal Center:

132.850
133.400
133.700
134.400

I have seen a listing for 132.550, but have heard no traffic there.

I almost forgot the military aero freqs. None of these are verified:

267.100 Dorval Tower
268.300 Dorval VFR (whatever that means)
275.800 Dorval Ground
282.400 Mirabel Tower
287.200 Dorval Arrival
323.200 Dorval Departure

If anybody can help with VHF/UHF pairings, please advise.

Thanks for the tip. The only freqs I have listed for Mirabel are:

463.550 Lufthansa ramp
469.050 Swissair ramp

I also have monitored these frequencies, but I don't know for sure if
"Montreal" means Mirabel or Dorval:

122.850 Sky Service
129.600 American
130.200 Grand Air
130.475 Frontier
131.000 Northwest

It sounds like NYSDOT has reorganized their radio scheme for plows and salt trucks. Several bases that were heard last winter are off the air and others have changed frequency.

The most significant change is the apparent migration from the half-duplex channel pairing of various base frequencies with the statewide mobile frequency of 47.40 MHz. Some of the trucks are conversing with their bases on the base frequency now. It seems to vary with the age of the mobile radio (maybe).

Also, I have heard at least one base station conversing with a mobile unit on 47.22 MHz, which used to be the statewide truck-to-truck channel.

Does anyone have any details on this restructuring?

In a previos post I inquired about places to get car-mounter antennas. These
are the places to which I was directed for higher quality stuff:

EEB
703-938-5309
323 Mill St. NE
Vienna, VA.

Radio supply store. Lots of stuff, knowledgable
employees but difficult to return bought merchandise.

Scanner World USA
518-436-9606
10 New Scotland Av.
Albany NY 12208

GM-1a Glass mount scanner antenna (25-1200mhz) 39.99 (october93 issue)
Ant-75 Mag mount (29-956mhz) 42.99 (other mounts same price)

Grove Enterprises
P.O. Box 98
140 Dog Branch Road
Brasstown, NC 28902-0098
1-800-438-8155

Ant-4 mag mount w/ motorola and bnc connector. 25-960mhz 24" whip

Antenna Specialist
(find a dealer near you)

Supposedly a very good place with a lot of selection.
Worth the trouble of finding.

achern@wam.umd.edu

255. Where to get scanner antennas

Newsgroup: rec.radio.scanner
Date: 1994-01-12 02:52:10 UTC
From: achern@wam.umd.edu
Message-ID: <2gvokq$hf6@cville-srv.wam.umd.edu>
Source record: 277902

I have several question for which I'm hoping to receive some net-wisdom.

I have a PRO-46 mounted inside my car. I'm using the suggested RS cigarette-lighter adapter. Assuming the scanner is always turned on, I have the following concern: When I start my car, the scanner turns on for a brief moment (ignition key at ON position), then it turns off when I actually START the car, then on again when the car is started and the key is released back to the ON position. Because the scanner is being turned on and off in an abnormal way (power removed from the adapter), might this be harming my scanner in the long run? The car is an 88 Camry, not that it really matters.

My second question is about weather. I live just north of D.C., and now-a-days the temperature can go below freezing. Can these somewhat extreme temperatures be harmful to the scanner (especially during more extended periods, such as overnight). Recently I have taking the scanner inside with me whenever I don't park in the garage.

Third is a question about antennas. Currently I am using RS's $10 (if I remember correctly) telescoping antenna mounted on the left-rear window with RS's Window Mount (roll up the window to hold the connector in place and attach any BNC-tipped antenna). If I were to buy RS's (Antenna Specialist's discone?) scanner antenna and mount it in the middle of my car's roof, would my general reception quality improve? (I scan everything - 46, 154, 494, 860 Mhz ranges; that's why I ask about general reception.)

Fourth: My car's electronics cause some (obviously) noticeable interference. Would opening the scanner up and treating the case with a shielding spray improve this situation to the point where the procedure would be worth doing (especially if this voids the warantee)? Are there any other ways to eliminate some of the interference?

Fifth: The way my scanner is mounted in the car, the display is difficult to read. What I do is simply clip the scanner to the fold-down-sun-block-flap (can't think of proper term for it) using the included belt-clip. This forces me to dangerously look up at the scanner display if I need to do so. Has anyone had cheap success mounting their scanner any other way (other than buying a $35-$55 cell-phone mounting bracket)?

I appreciate any information given, and will summarize.

Alex Chernyakov
achern@wam.umd.edu

>broadcast stations and VHF/UHF television stations. How well does
>it do at picking up regular AM broadcast stations with the duckie
>antenna that comes with it (e.g., is it on par with a Walkman)?

Well, on FM stations it does very well. On am the reception isn't as clear
as a dedicated AM radio. However, this is true with any portable shorwave
reciever.

>Does it take ordinary batteries so that if I had a good battery/
>recharger setup I could run it off batteries as long as I liked
>(more or less)?

I use the Radio Shack Hi-Capacity Ni-Cads...get about 7-8 hours continuous
use per charge.

Hi, I've become interested in acquiring one of the new 900 MHz cordless phones. I've seen several models, but I'm somewhat confused about channels and such. I've seen as few as 10 and as many as 100 channels advertised, and also something called spread spectrum, which I assume sweeps the whole bandwidth. The spread spectrum phones seem to be the most expensive, i.e. $300 or more. Also, some phones seem to be digitally encoded while others are still analog (and, I would guess, more prone to interference). If anyone could point me to a review, or could provide a review of a particular model, I would appreciate it. I've been looking at models from Tropez, Sony, Uniden, Escort, Panasonic, and Cobra. The Tropez seems to be very attractive because of its $199 or less price. Thanks in advance.

Try 869.01 - 893.97 at 30 KHz channel spacing. It is illegal to monitor
cellular calls in the US.

From: bmiller@landesk.intel.com
Message-ID: <2h147a$877@ornews.intel.com>
Source record: 277828

I have never heard anyone praise the Knwd RZ-1, and like you say, the Undien 8100 is not DIN size nor easy to mount in tight spaces. The only other alphanumeric scanner I can think of is the Uniden 8500XLT, but this is not the right size either (too big).

I don't think there is a scanner made to fit your needs, but you may want to consider a ham radio. While not optimized for scanning, I know yeasu makes one with alphanumeric display. You could even get your ham license while your at it. I know this is no big help, but I think you may need to compromise on your requirements :(

267. What batteries for the PRO-43?

Newsgroup: rec.radio.scanner
Date: 1994-01-12 15:25:17 UTC
From: cab@col.hp.com
Message-ID: <2h14ot$3r1@hp-col.col.hp.com>
Source record: 277827

Opinions, please, from PRO-43 owners:

While I'm waiting to receive my new PRO-43 from Marymac (got it for $275, as a data point), I'm trying to figure out what NiCd batteries to buy for it. I'll be getting them at Radio Shack (unless there are better ideas), but they offer a few types.

The standard purple one (23-125) is 650 mAh, and the Hi-Capacity version (23-149) is 850 mAh. If it only mattered that they'd last longer, I might get the Hi-C ones. But I know NiCds like to be charged at a certain percent of their capacities, so depending on what current the 43's AC adapter charges them with, the cheaper ones may actually be better in this case. Anyone have ideas here?

Also, the Hi-Capacity batteries are listed at $5.99 *each*, but a RSdroid told me that that was the twofer price. I'd like to believe him (I don't wanna spend $36 just for batteries, but I could live with $18), but last year's price was $5.95 each. Does anyone know for sure? Misprints two years in a row?

Apologies for posting this to both scanner groups. I know that folks are trying to migrate to one in particular (rec?), but there continues to be traffic on both (and I'd like to get an answer before I head home, since it may arrive today). Thanks!

268. CPR for the repeater?

If you want real power, try AA NIH (Nickel Metal Hydride). They are 1.0
Ah(!) and use the same chargers as NiCads.

Real Goods in Ukiah, Ca (1-800-762-7325, visa/mc) sells them for $5
each. Tell 'em you saw it on the Internet. They have an amazingly wide
variety of electrical devices (batteries, chargers, flashlights, solar
panels..) targeted to `off-the-grid' types.

On page 12 of their Winter sale catalog, they have a drawing of a
PowerBook connected to a Portable Powerpack ($69) being charged by a
Portable Folding Solar Module (regularly $199, on sale for $179).
Great stuff.

274. AR1500,YUPITERA

Hello once again,
Yesterday I posted a message that I recieved the AR1500 for
Christmas and wanted to know how it stacked up against others...

The resounding messages was to return it and get the yupitera (sp?)

BUT, I want to know what features the yupitera has that the 1500 doesnt

Also I would like to know about any compliants anyone has about
the yupitera!

PLEASE respond quickly I have to return the AR1500 by friday for an
exchange its already been to long just to get my money back...

-thanks for all the info.

276. Questions about communication basics

Newsgroup: rec.radio.scanner
Date: 1994-01-12 18:07:10 UTC
From: lmctrle@LMC.Ericsson.SE
Message-ID: <1994Jan12.180710.16918@exu.ericsson.se>
Source record: 277921
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi there,

I have been reading the net on a regular basis and enjoy reading information exchange among netters. Now I have few questions about the communication basics and hope someone could enlighten me or expand my knowledge (I took some courses about communication theory few years back, but I guess either I was dumb - well, mark was low- or my memory was as good as that of a cow -please no offence to cow lovers). Here are my questions:

1) What are WFM (wide FM) and NWF different from regular FM (Advantages/Disadv.)? What media uses them? (TV/News stations..). What type of signals do scanners pick up if they (scanners) do not have AM/FM button? On expensive scanners, how do they pick up these types of transmissions?

2) USB, SSB and LSB, what the heck are they? I understand they are part of the whole sideband and carries the all info as the original band does. What are the advantages and disavantages using these bands in term of brodcasting distance, info fidelity and so on.

3) What does squelch button on scanners do? What is the communication principle, if any, behind this?

Thanks in advances

/Trien

>>7100 requires. I use this instead of the supplied adaptor as that is
>>designed for 100VAC.

> Roy, what does this modification do to the radio?
>
> Mike in Arkansas

The supplied adaptor is designed to work off of 100VAC instead of the
110-120VAC used in this country. Others had reported that their units
got rather warm from the presumed (slight?) overvoltage that came out,
that is, possibly somewhat higher than 12V. In order to avoid this,
I bought a Radio Shack 12v power "cube", removed its connector, and replaced
it with a barrel connector that will plug into the Yupiteru. Doesn't modify
the radio at all.

: First of all, has anyone ever used the RS Discone antenna. They
: claim freqs. from 25-1300 MHZ? Is this true and how well does it
: work? Or is there a better antenna available for less than $100
: somewhere other than Radio Shack?
: Second, is it possible to hook-up the same antenna to two different
: scanners? I would like to just split the coax instead of putting
: a switch on it. Would this affect the performance of the antenna
: or scanners?
: How much more range would a discone give the scanner? I used to
: pick-up Boston Police Area D and now I get some of the freqs, but
: I have to move the scanner around. So, I'm assuming it's the antenna
: on the scanner, as I can get my town police and Public Works no prob.

Dave, first go visit U-do-it Electronics on 128 in Needham. They carry Antenna Specialist brands. They are better performers IMO and experience. Look at the catalog, since they may not have much displayed. I have an MR-1 home antenna (I think that's the model). Cost was around 60 bucks.

Second, it is possible to connect two scanners to one antenna. The scanners want to see 50 ohms on the coax, this can be accomplished by splitting the connection at the antenna. Problems arise when you split at the scanner, and try to go to two antennas. Actually, at my home I have one coax that I "tap" into at about 20 feet from the antenna. This is for my bedroom scanner, then I continue to run another 70 feet downstairs to another scanner. The extra length hurts on 800Mhz (downstairs), but other freqs are fine.

In my current setup I'm not sure what the scanners are seeing as far as proper resistance (50ohm), maybe someone out there can enlighten me.

>
>John Monahan I don't speak for GTE
>GTE Government Systems Corp They don't speak for me
>

In this "kill" mode as you say, the mobile station is not repeated through the repeater. The base (dispatcher?) signal goes out over the repeater to the mobile. When the mobile transmits, the receiver is only fed to the dispatcher, and not sent to the output of the repeater so you only hear the dispatcher. If you want to hear the mobile station, you will have to pick it up on the input frequency to the repeater. This may or may not be possible depending on the mobiles location and output power. For most public service, I think the input freq is 5MHz above the output frequency, but there are no guarantees on this.

Sorry I cant requote your questions. My site rejects any messages
I send if my comments are not more lines than the original text.

There are two common FM types: Wide FM and Narrow FM. Some people
call them WFM and FM while others call them FM and NFM. So FM is
relative. When a signal is frequency modulated your voice deviates
the center frequency by some amount on each side of the center. In
wideband FM, there is more deviation (I think it's around 150KHz).
Narrow FM is only around 10 or 15 KHz wide. So your receiver needs to
be set to the proper mode so that the filter size matches the expected
signal width. If you tune WFM with a NFM scanner it will be chopped up
since the filter is too narrow and the outside ends of the deviation
won't get through.

Most radio comms are NFM. TV audio and FM broadcast is wide FM. As you
may have noticed, wide FM sounds better. THat's because there is more
of the true signal information there.

Your basic scanner picks up NFM so you can listen to police, fire, or
most any 2-way comms. As a side note, cellular comms seem to be
slightly wider than NFM (anybody know the numbers?).

I'll let someone else explain SSB.

I'm not sure what you mean by squelch "button". A squelch control
adjusts the threshold of the signal required to turn on the speaker
amplifier (this is an educated guess). A squelch button might set your
scanner to some set threshold level found useful for most situations.

Well, Monitor America says that for "State Highway Maintenance", 47.30 and 47.38 are statewide, 47.28 for Eastern districts, and 47.14 for Western districts. I live near Philadelphia, and have the first three of these frequencies in my scanner. They all seem to get used pretty heavily (especially 47.30) when the bad weather comes along and it's time to send the salt trucks out.

I've got the Uniden 5100 and it appears to be the current favorite with
some in the CEFORUM on CI$. It's pricey but falls into the you get what
you pay for category. I really enjoy mine. I don't get a mile range
out of it because I don't live on a farm. However, the signal quality
while walking around is much better than any other cordless I have.
Haven't seen any reviews but on CI$ someone has posted a summary of all
the current models and their features

Not all of the UHF band gets blocked, 'cuz some places make use of the first few MHz of the 470-806 band for police and other such agencies (I think the range is 470-512). That sub-range seems to be included quite often, at least on the scanners I've seen. Don't know of mods to get the rest of the UHF (i.e. channels 21 to 69).

Those listings agree with what I have found in other lists. I have the PA state FCC database, but haven't had time to look at it too closely.

The only way to know for certain is to program in those frequencies and see if PENNDOT is using them or not.

I often see technical questions in these groups that could be better answered using the old fashioned RTFM approach. That is, if it's the right manual. ;)

Service manuals are not that hard to get, nor are they usually expensive.

I got a Pro-43 service manual with schematics and details of ALL the diodes (cellular, low band VHF...) for under $10 by calling (800) 442-2425 and giving them my Visa number.

I got my GE SuperRadio `Service Information' from Thompson Consumer Electronics, (502) 491-8110 (Visa/MC). Friendly folks, ask for their catalog.

Sony sold me schematics for my portable shortwave radio, but they wanted me to write and send them a check, not call. I can't find the address just now (it was in New Jersey), but ask your local Sony repairman, maybe they can tell you where they get theirs.

Anybody have other sources?

293. 8ch/sec -> 100ch/sec

Message-ID: <1994Jan13.050819.29647@cronkite.ocis.temple.edu>
Source record: 277846

I just thought that I would share a little tase of success in my endeavors in modifying my scanner.

I have a rs pro 2022 which scans at 4 channels per sec on slow speed, and 8 channels per second on high speed, (at least it DID..) anyway, upon purchace of the scanner modification handbook it told me to replace the 2 mhz crystal with one that is MAX 4 mhz. I looked around and the slowest crystal I could find was a 10MHZ crystal. Well, for $3.50 I decided I could either end up with a mach2 scanner or a $200.00 doorstop.

I got home and preformed the mod, simple as pie.. little solder and a little clip and I was done.. Popped the 'ol one out and the new one in and walla.. from 8 channels per second scan to a whopping 100 channels per sec. (well, approximately.) it should actually scan like 80? I dunno.. 2.3 seconds per 100 channels.. MY math might be a little off.

Anyway, just thought I would tell ya since the pro2022 scanners in my area are on sale for 199 or something of the like because they are discontinued (I think)

Next, comes the 3,120 channel modification. It'll be amazing if I can get that one done.. heheh..

Sony has an office in Kansas City that takes Visa and Master Card,
and takes orders over the phone. I've found it easier to deal with
them than the people in Mahwah, New Jersey. Phone number is (800)
488-7669, or if you don't have 800 service to the US, (816)
891-2553. I got a service manual for my PCM-F1 from them and found
them very helpful.

I purchased Kalmbach's _Compendium of American Railroad Radio Frequencies_
(12th Edition) on Tuesday. The book has complete listings for all roads
using AAR frequencies in the U.S. and Canada, as well as listings for
industrial, tourist, museum and transit system roads. It also lists
frequencies used by roads in foreign countries(Mexico, Australia, Great
Britain, Germany, Ireland, New Zealand, and Sweden).

The book also lists major metropolitain areas in the U.S. and Canada
and the various roads and frequencies in those areas.

The cost was a bit stiff ($16.95 list), but I think it was worth it.

BTW, the book is available in the D.C. area at Union Stations Great
Train Store.

I have a TROPEZ 900DX and I think it's a nice phone. However, their customer service is really slow for repairs. I sent my phone in for service before Thanksgiving. They sent me a new/refurb phone before Xmas. I had to send the replacement phone back last week because of a static problem. Today (1-13) I am still waiting for my phone. The original problem was that I can here my conversations UNENCRYHPTED on 448 Mhz used by ham radio operators.

Good Luck,

>
> John Monahan I don't speak for GTE
> GTE Government Systems Corp They don't speak for me

The repeater takes audio from the input frequency (mobile's output) and repeats it on the output frequency (mobile's input). When the repeater is killed, the incoming audio is not repeated. Mobile's and scanners cannot hear what the other mobile's are saying. Since the dispatch usually has a dedicated link to the repeater, they can hear the mobile and respond. Think of it as a 2 frequency duplex system. Turning off the repeater is a way of keeping sensitive information from being rebroadcast. Of course, if you know the input frequency to the repeater, you can listen there for the output from the cars. Since the output from the cars is less than the repeater, you must have a good system to be able to hear them.

If your looking for single band coverage and you've got a few bucks to spare, then Motorola's MCX1000 will do the job. It's also very good in bad intermod locations. There are quite a few drawbacks however. It's single band and not programmable from the front panel. You would have to purchase the interface and software to reprogram it yourself.

Steve
* JABBER v1.1 * If at first you don't succeed, call it Windows NT.

Omid Ramin (g5g192@rick.cs.ubc.ca) wrote:

: So which one is better? What should I cut to? 5 feet or 70
: inches?

I posted 70 inches, which was a typo on my part, it should have read 72 inches, which is resonant at 39Mhz (1/4 wave). Anyway, the formula is 234/MHz = length in feet. For 46MHz you need an antenna about 61 inches. My target freq was 39MHz, so I cut to 6 ft. But the 1/4 wave is pretty broad banded, so the state freqs at 42-46MHz still come in very well.

: Thanx for your help. I'd love to hear from someone who's actually
: done this. ttul!

Yup, I actually did this. Of course you realize it may perform quite poorly on other, higher frequencies.

I thought I'd throw in my 2 cents regarding batteries since I've seen some articles of late here on the net. When I recently bought my Pro-46 from Radio Shaft, they naturally were out of the adaptors for the charging jack, so I decided to buy a Millenium rechargeable battery system. For $30 I got 4 Milennium AA NiCads and a charger that charges all 4 of them up in about an hour. I'm never without batteries as a result, since they last all day -- I charge them up at night. I use the Lo Battery indicator on the scanner to ensure complete discharge before recharging. I thought it was a worthwhile investment given the number of uses for AA batteries around my house.

Surely, your scanner runs through 100 channels per second now, but does
it still stop when there is a signal? The scanner needs to rest a while on
every channel to detect the presence of a signal. Maybe it stops on strong
signals but i suspect weaker transmissions can't stop it from scanning now.

: The latest DAK catalogue (just got it yesterday) has the BC200 XLT for $199.

I believe the latest DAMARK catalog (got it last week) has factory
serviced BC200XLT for $159.95. My first scanner was a BC100XLT
factory serviced from DAMARK and it worked fine. I traded it for a 2m
HT to a friend who still listens to it every day. At that time I
upgraded to a BC200XLT I bought used for $210. Just a week ago I sold
the BC200XLT for $150 and bought a PRO-2006. I highly recommend the
BC200XLT and the PRO-2006.

I don't know about that, but his math is a bit off. If you get 8 ch/sec
with a 2 Mhz crystal, you should only get 40 ch/sec with a 10 Mhz crystal...

Um, the construction of the Radio Shark discone unimpressed me greatly. The ICOM discone construction is worlds above it. Dunno re the Grove. I have an ICOM discone and am not displeased. It is not a "great" antenna. But it does its job about the way I'd expect.

> Organization: University of Maryland, College Park

> (power removed from the adapter), might this be harming my scanner
> in the long run? The car is an 88 Camry, not that it really matters.

Yes, it is possible. You should start up the car with the scanner turned off. Then the voltage spikes that may be generated when the car starts have less opportunity to invade your scanner.

> temperatures be harmful to the scanner (especially during more extended
> periods, such as overnight). Recently I have taking the scanner
> inside with me whenever I don't park in the garage.

Yes, but theft may be a bigger risk if your scanner is easily removable. Take it inside with you (or lock it in the trunk) regardless of the temperature.

> were to buy RS's (Antenna Specialist's discone?) scanner antenna and
> mount it in the middle of my car's roof, would my general reception
> quality improve? (I scan everything - 46, 154, 494, 860 Mhz ranges;
> that's why I ask about general reception.)

I assume you really meant to ask about a mobile scanner whip and not a discone. In general, the best place for a mobile antenna is the center of the car's roof.

> Fourth: My car's electronics cause some (obviously) noticeable
> interference. Would opening the scanner up and treating the case with
> a shielding spray improve this situation to the point where the

Probably not. The interference may be entering the scanner via the power cable and/or the antenna itself. A better solution would be to fix the car so it generates less radio noise. (Resistor spark plugs, grounding all doors to the chassis, capacitive filtering on the alternator, etc.)

> (can't think of proper term for it) using the included belt-clip.

The sun visor? :-)

> This
> forces me to dangerously look up at the scanner display if I need to
> do so.

There is some risk in looking away from the windshield at your scanner no matter where it is mounted. I think the sun visor position is pretty hazardous anyway if you should get into an accident. A scanner can make a pretty good dent in your cranium.

Scan speed is not the only thing to consider. When I put a 12MHz xtal in my Pro-2005, Bill Cheek told me that he didn't think it would run reliably, and to get a 10Mhz xtal. The issue here is that the microprocessor may not be able to operate at the speed you mention. It may LOOK like your scanning that fast, but is it hitting every channel, and more importantly, is there enough time to lock on to a signal so that it gets recognized.

I'm not saying what you did, can't work, but I would advise caution when trying this. The proof is in the pudding...How does your new 100ch/sec scanner work now?

I would think that if a jump from 8 to 100 ch/sec were possible, that the manufacturer would build it to scan faster than 8 ch/sec.

Let us know how it works at such a fast scan rate. I'm sure many people would be interested in doing this mod.

I like to keep mod files when I run accross them and I have never
seen a freq. expansion mod for the AR900. AOR scanners are not
modified that much because 1) There are not that many out there
(relative to other brands), and 2) scarce or non-existant service
manuals.

Or, better yet, get the FCC records for the agency in question (like
via Grove or somesuch) and see which frequencies the agency is licensed
for. They may be borrowing frequencies from another local agency...

I have the same scanner and made the crysatl mod some
time ago. With an 8MHz crystal, the performance was a bit
intermittent. It failed to stop on some signals my R1 stopped
on, and on one occasion the keyboard froze for a second or two.

Dropping the crystal down to 7.4xxx something did the tick, and I
now get about 45 chan/sec reliably, and with good signal detection.
Coincidentally, I ended up with the same crystal freq that Bill
Cheek recommended as the maximum in his book. The dude
definitely knows what he's talking about. :-)

>single band and not programmable from the front panel. You would have to
>purchase the interface and software to reprogram it yourself.

Well, the MCX1000 is available with a dual-widespace front end, which
gives you two 6MHz band segments, but it isn't going to cover all of
146-174Mhz all at once...

Just be careful not to transmit on any frequencies you shouldn't. I believe
you'll need to enter 'Blank' for the transmit frequency field.

I use an MCX100 in the car for amateur radio. Though the receiver is as
hot as any modern Japanese radio, the front end is very resistant to intermod;
I've got the dual-widespace front end and it does work great. The MCX1000
is essentially the same radio with upgraded control electronics.

Sam's warehouse in Atlanta has Panasonic nicads on cards of, I think, 6
cells for about $8.00 a card. These are probably only 450 mah, but at
that price you can buy 2-3 sets with holders, and just change them out.

I don't own one of these voice activated recorders at this time but have owned one in the past. I found them useful for tracking scanner spectrum that is dead but where I wanted to see if a signal existed. I used a patch cord and just tested for the proper level at the beginning of my recording, made sure the squelch was set properly so it wouldn't open without a proper signal and went off to bed or whatever. As I recall it worked quite well. This was a few years ago and back then they had a sensitivity voice switch. I made sure to keep it on minimal sensitivity so the scanner had to activate it by pushing it a bit.

djc@terapin.com Out!

335. Mods for RS PRO 2020?

In my opinion,the best discone is no discone!Seriously,I have the Icom one and it is made very well but it doesn't compare to any other type of omni antenna I've compared to it.It does have one advantage that makes me keep it up there....It has a flat SWR on just about any freq above 50mhz that I can transmit on,so it makes a great backup antenna.The best all around omni scanner antenna is the one that grove sells as the monitenna and channel master sells as the 5490(?)a.In every way,it will beat the discone hands down.the only drawback is it's kind of flimsy.

Also, the GTE airphones in commercial airliners are in the 900Mhz. I
think the freqs are in Monitor America

Yes, I have noticed that it isn't stopping on some frequencies that
are active. However that only appears to happen during a limit or direct
search. I am going to go down to the Max reccomended of 7.whatever that
bill mentions because when I press manual it will jump like 4 or 5
frequencies, as if I had held the manual key down too long. Programming
is a pain in the but too, because you have to be really really quick with
the thing.
Actually, I just realized upon looking at the book that the max reccomended
is 4 something, not 7, But I got 10 to work, anyone think a flip flop will
work? I could always use that since rs seems to not stock any crystals
over on this side of the ship anymore.

I have to do some more testing before I come to an utmost conclusion.
I'll keep ya posted on what happens, or for that matter what dosent'

343. vhf weather radio

I'd like to get one of those little "weather radios" that's pretuned to the vhf NOAA frequency. Who sells these? How much are they? If Radio Shack carries them - is their brand decent? Are there any particular features to look for on radios like this or are all models pretty much the same?

Thanks -

rs/rshapiro@bbn.com

345. MODS wanted for ALL radio

Newsgroup: rec.radio.scanner
Date: 1994-01-14 20:49:37 UTC
From: wy1z@bach.coe.neu.edu
Message-ID: <WY1Z.94Jan14154937@bach.coe.neu.edu>
Source record: 277801
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

I want to compile as complete a library of mods for every shortwave radio, ham radio, and scanner.

Once collected, they will each be placed into their respective locations according to manufacturer in the ham radio FTP area on world.std.com.

Any pointers to FTP, FSP, mailserver, World Wide Web, and Gopher sites, as well as whatever else you can offer would be greatly appreciated!

Thanks much!

Scott

I agree. I started out with the splitter and went to an
all band mag mount. I'm seriously considering switching back
to the splitter especially since I am looking forward to
installing a 2m rig and could use the antenna space on my
little truck.
I used the RS model that looks like a silver disk and
has 2 outputs. It's just too cold these days and I fear my
hand would fuse to the antenna :-).

> guarantees on this.

It depends on the frequency band.

VHF High band - no standard outside ham bands.
UHF "low" (450-470 MHz) - input up 5 MHz.
UHF "T" (470-512 MHz) - input up 3 MHz.
Microwave (800 and up) - input down 45 MHz.

> ICOM AH-7000, Radio Shack, or the Grove discone? Is there a discone
> out there better than one of these three?

The AH-7000 is the most expensive of the bunch. Grove sells the Diamond D-130J discone, which is the best discone in its price range (at least as good as the Icom but cheaper). The Radio Shack discone lacks the separate vertical element for acceptable VHF low band reception. Depending on sale prices, you may be able to get by with the Shack's antenna if you add one of their standard CB mobile whips to it. However, I believe the Icom and Diamond discones are made of more sturdy material. Maybe someone can jog my memory on that score.

Aaack! All of a sudden, the 2-meter ham band (144-148Mhz) seems jammed with cellular phone conversations! Has my trusty Yupiteru MVT-7000 died? These strange signals are accompanied by a high-pitched tone, and uncharacteristically have both sides of the conversations. Help! I've read some books on imaging and other scanner quirks, but I can't for the life of me figure out why something that should be up in 875Mhz band is now in my 146Mhz band, single-freq full duplex.

BTW, thanks to everyone who posted or mailed me with suggestions for my DF antenna search; I turned up some old QST articles, ca. 1980. I was hoping for something a little more recent, although the doppler design looks intriguing.

Thanks again in advance for any advice and service dept. rec's! :|

-It kind of sounds like intermod.You might be hearing the OLD car phones
that are down on 454 mhz.ANY scanner,will hear "junk"like this at various
places around every town I've ever been in.I go by a cellular tower that
just kills my HT and my scanner with cellular calls on 2 meters,800 trunk on
460 mhz,all kinds of pagers,and lots of noise.If you only get this noise when
you are at certain places,it probably was intermod,and there isnt a whole lot
you can do about it.But,if it's constant,your radio is sick.Hope not.

Do you know if there's a new cell site in your vicinity? Not all of
them use the large blue monopole towers with the triangular-shaped
platform on top.
Some sites are very low-profile (physically & electronically).

I hope the problem disappears soon. You must be terribly ashamed &
embarrased to be subjected to 'private' conversations about sex, drugs,
embezzlement, etc. when simply trying to tune in the hams on 2-meters,
saying stuff like "QSL and fine business on your bursitus not acting up on
you today, Fred!" ;)

Of course since there's no willful intent on your part, I don't
think that you're in technical violation of the ECPA.

Tim

lmctrle@LMC.Ericsson.SE (Trien Le) writes:
:
: 2) USB, SSB and LSB, what the heck are they? I understand they are part of the
: whole sideband and carries the all info as the original band does. What are the
: advantages and disavantages using these bands in term of brodcasting distance,
: info fidelity and so on.

More correctly, they describe part of the amplitude modulated transmitted signal. An AM signal contains a carrier, and two sidebands. When the carrier is modulated 100% - two thirds of the power is in the carrier, and only one third is in the sidebands. As the carrier contains no useful information, it is nice to suppress or eliminate it - and transmit only the part containing the intelligence. This is called sideband communication, and can be either single or double sideband. There are two sidebands, the upper sideband (USB) and the lower sideband (LSB). These contain identical information, except that the frequency relationships are inverted (ignoring phase). Since they are identical, a further improvement occurs if one of the sidebands is also suppressed. This mode (SSB), is the most common currently used for non-music transmissions. Since all the transmission power is now going into the minimal bandwidth, the range is maximized. In some cases, even though the range may not be any further, it would be stronger in the area where it can be received.

The major disadvantage is that the recovered signal generally does not sound just like the transmitted signal (voices tend to sound gravely or a bit like Donald Duck). Since there is no carrier, its analogue has to be reinjected in the receiver - and this tuning is critical for clear reception.

heglowstein@BIX.com (heglowstein on BIX) writes:
: >when trying this. The proof is in the pudding...How does your new
: >100ch/sec scanner work now?

It doesn't scan at 100 ch/sec. The original poster had serious problems
with his math. See below.

: I have the same scanner and made the crysatl mod some
: time ago. With an 8MHz crystal, the performance was a bit
: intermittent. It failed to stop on some signals my R1 stopped
: on, and on one occasion the keyboard froze for a second or two.
:
: Dropping the crystal down to 7.4xxx something did the tick, and I
: now get about 45 chan/sec reliably, and with good signal detection.

Since the scanner scanned at 8 ch/sec with a 2 MHz crystal, that means
that it scans 4 ch/sec for each MHz. Assuming your crystal is 7.5 MHz,
the scan rate would be 30 ch/sec - not 45.

: Coincidentally, I ended up with the same crystal freq that Bill
: Cheek recommended as the maximum in his book. The dude
: definitely knows what he's talking about. :-)

He certainly does.

(Image of smiling ball with hands) Don't Panic!
What you're hearing is nothing more than an old mobile telephone system
from the pre-cellular days. It lies in the 152MHz range and like any other
strong signal (Anyone hate pager signals as much as I do?), is overloading
your scanner.

RE: Cellphone interferance...

I'd suggest taking a look around your area for a 'cell site'
and its characteristic antennas. Try your local land use planning
folks (zoning board or whatever) for info on any recent sites
that were approved. Figure recent to go back maybe a year.

I've heard this sort of thing locally (so-cal area) and my
dual.band ft727 is real prone to it, but I've also heard
just a bit on my UHF Micor as well.

The sum of my reactions is that while the ft727 is... well, what it
is, too broadband and to hot for what it should be asked to do,
that the Micor has heard this crud as well leads me to think that
these folks have skimped on the cavities and circulators on these
sites... and that there is garbage comming out of them where there
should *not* be.

While I don't at present have a battery-operated scanner (although I plan to buy one soon), I have used the Millennium batteries and fast charger with other items (remote controls, etc.) Here is a problem I have had.

After using them for only a month, the Millenium batteries seem to discharge _Very_ quickly in a programmable remote control (constant battery drain). I am wondering if it may be due to the fast charging rate? or maybe I got some bad cells? I did not seem to have this problem before, using other cells and a standard (6-8 hr.) charger.

BTW, the fast charger detects Millenium brand batteries because of a small detent on the (+) tip of the battery. I guess this is to encourage owners to buy the Millenium brand, since other brands (without the depression) will only charge at the slow rate. I have succesfully put a depression in the (+) end of other batteries using a 1/8" pin punch **be very careful so as not to put a hole in the tip of the battery**. Only a slight depression is required. Go a little at a time until the charger recognizes your *modified* batteries as Milleniums. This is advantageous as the Milleniums are more expensive than other brands. Also, if you already have other NiCads laying around, you will be able to get effective use out of the quick charger.

I have not noticed any problems with fast charging other brands of batteries, and I have not noticed a fast discharge rate with other brands.

Anyone have any info on whether or not it is safe to charge other batteries at the faster rate?

hi everbody!
scanning cellular phone frequencies is illegal in most countries....
so here is a list of cellular phone freq. you should NOT!:-) enter into your
receiver/scanner (depending on where you live)....
i found this listing in the '92 PROCOM antenna catalogue. it's not very
up to date but i think it will tell you where NOT!:-) to scan .....

have fun:-)....
Harald

The only other mobile unit I know about is the aging Kenwood
: RZ-1, which is exactly DIN sized and has 100 memories with alphanumeric
: capability. Unfortunately, not only is it old, but overpriced, and I have heard
: that its scanning abilities are marginal.

I don't know why you think the abilities of the RZ-1 are marginal, I have had two of them scanning on my news desk for over 3-4 years and they have NEVER been turned off. The do a great job. Their scanning rate is not as fast as many of the newer radios, though. It does have an alpha-numeric display which is a life-saver for me. So far, the newer radios, like the new uniden with Alpha, does not show me too much, except scanrate, over the RZ-1. It is expensive, I agree, but does a great job and lasts forever.

: Thanks very kindly in advance,

: Chris McCormack (mccormac@galaxy.mpr.ca)

Ahoy, Trien Le!

lmctrle@LMC.Ericsson.SE (Trien Le) writes:
> Here are my questions:
>
> 1) What are WFM (wide FM) and NWF different from regular FM (Advantages/Disad
> What media uses them? (TV/News stations..).

As you're probably aware, FM is "made" by swinging the transmitter's frequency up and down around a center frequency. The difference between WFM and NFM (narrow) is the maximum amount of swing away from the center frequency that is allowed. The larger amount of swing of WFM signals provides for better signal fidelity, at the cost of bandspace used. As a rule, you can expect NFM to be used wherever FM is going to be used, *unless* the signal is eventually going to be used for broadcasting. WFM is on the standard FM dial, it's used for studio-to-transmitter links (STL's), and is usually used to link remote reporters back to their stations. A notable exception is helicopter traffic report links, where NFM is usually the norm.

> What type of signals do scanners
> pick up if they (scanners) do not have AM/FM button? On expensive scanners, h
> do they pick up these types of transmissions?

Of course, this has a lot to do with the capabilities of the scanner. But scanners invariably have a mode associated with each band they're designed to receive. That's fairly simple, because nearly all the communications scanners receive are NFM, with the exception of the civil (108-136 MHz) and military (upper 200 to lower 400 MHz) aircraft bands, which are AM.

Inexpensive scanners will sometimes skip the aircraft bands just so the AM section doesn't have to be provided. On the more expensive scanners, the user has an option to override the AM/FM default and switch to the other mode. On the high-end scanners (say $600 and up) there is probably a default for each band, but the user can select AM, FM (narrow, by default), WFM, USB, LSB all the way up and down the radio's range.

> 2) USB, SSB and LSB, what the heck are they? I understand they are part of th
> whole sideband and carries the all info as the original band does. What are t
> advantages and disavantages using these bands in term of brodcasting distance
> info fidelity and so on.

Well, you've got the basic idea. [Readers not interested in the radio theory can skip the next two paragraphs.] Any time two or more frequencies are mixed, there are new frequencies produced. This is true of radio, sound, light -

it's a general principle of wave mechanics (it's the most common way to tune musical instruments, incidentally). For two tones, we get the original two tones, plus one tone which has a frequency which is the sum of the original frequencies, plus one tone which has a frequency of the absolute value of the difference of the two original frequencies.

When you mix an audio note with a relatively much higher frequency (like when mixing audio with a radio frequency) the new frequencies are clustered around the much higher radio frequency. When you mix something complicated like voice or music, there are a whole slew of new signals around the radio frequency. Those which are the sums (and will be above the radio signal) are collectively called the "Upper Side Band". Those which are the differences (and will be below the radio signal) are collectively known as the "Lower Side Band." The LSB signals are a mathematical mirror of the USB signals, too. It was eventually worked out how to send only the USB or LSB and reconstruct the original signal from only one of those components.

-t /*theory mode off*/

Anyway, this is a mixed blessing. SSB transmitters can devote all of their amplifier power to the sideband instead of the full signal. The SSB signal will require less bandwidth, too. There are other things which are much more complex - such as SSB vs. AM in surviving interference and fading where only part of the AM signal (or all of the SSB signal) would be affected. Overall, SSB is worth doing, for some applications. But the cost of these benefits have to be considered. Receivers have to be more complex, the user of the receiver has to know a little more about tuning the signal in. To keep music listenable (on the correct pitch), the tuning must be _extremely_ stable and precise.

BTW, on some radios you'll see a mode selection, labeled "CW," which is intended for "continuous wave" (Morse code) signales. This is different from radio to radio, but the "CW mode" is either LSB or USB, but often with different audio filtering. On the Sony 2010, there is no difference - the LSB button is labeled "LSB/CW", but CW is just as receivable on USB.

> 3) What does squelch button on scanners do? What is the communication princip
> if any, behind this?

A squelch circuit is just used to silence the radio whenever it is not receiving a signal of a minimum strength or higher. The squelch control (usually a knob) sets the level of signal strength required to turn on the audio of the receiver. It doesn't affect anything as far as the signals go. It just keeps the listener from having to listen to the annoying hiss when there's nothing to listen to. Of course, the batteries in a radio will last longer when they don't have to run the audio section, too.

Hope this helps!

Cheerio!

I have two Yupiteru MVT7100 handheld scanners for sale. One is new the other has seen about 6 months of infrequent use. The used one is like new but isn't. I picked up an extra one last trip to Japan and now have decided to sell them both as other financial considerations have arisen.

The new one is $575
The used one is $525

Get one now while you still can!

372. CellPhone Imageing update...

Newsgroup: rec.radio.scanner
Date: 1994-01-15 20:19:56 UTC
From: miweber@apollo
Message-ID: <2h9j5c$d3h@sol.ctr.columbia.edu>
Source record: 277678

Thanks to Tim, Barry, Bruce, and Alan for their insightful and helpful contributions. Sadly, I think the problem is more severe than any of us anticipated. Today I hunkered down with my old PRO 2004 and the 7000 to try to pin the spread down. Here's what I found:

'Real' freq: 'Image' Freq: diff:
857.7375 132.770 724.9675
858.4875 133.145 725.3425
859.7375 133.770 725.9675
860.7375 134.270 726.4675
867.8625 135.845 732.0175
...

Seems the problem is not confined to the 2 meter band. This happens all the way from 120Mhz or so up to 150 or so, or at least, that's as far as I've bothered to track it. The public safety freq's listed above were easier to hold onto than those pesky car phones that keep switching around. Believe it or not, I don't WANT to hear the darn things! If I did, I'd pop up to the 800's where they belong. I just want them out of my low band! Once again, anyone have a favorite service department?

TIA,
Mike Weber

Ref. the Yupiteru 7100. Well, without making a big deal,
it's about the best scanner I have ever used.
It's not perfect, but it has as much sensetivity as any unit
I have ever used.
The spacing is, 1, 5, 6, 9, 10, 15, 25, 50, and 100khz.
So, you could use 15khz spacing for those 30khz spaced
channels.
Also, yhou have nbfm, wbfm, you will never have to sweat
getting t.v. audio when you want it.
Can't say enough about the scanner.

According to a recent article in "POP COMM", NJSP is
using 800MHz TRUNKED systems state-wide. This can present some
interesting scanner challenges. They are operating 866-869 and
935-940. q

I would like to thank everyone who so far has offered information on mods, whether their own information or pointers to FTP sites.

The following list shows the current directory structure of the mods section on world.std.com. The path for those without World accounts is: /pub/hamradio/mods

As you can see, I have created different subdirectories for each manufacturer to help make it easier to find what you are looking for.

Please keep the mods coming, especially for mods not shown below or for updates to currently existing mods.

380. Controller prog for FRG-9600 available

Newsgroup: rec.radio.scanner
Date: 1994-01-16 12:35:23 UTC
From: asirene@ntuvax.ntu.ac.sg
Message-ID: <1994Jan16.203523.1@ntuvax.ntu.ac.sg>
Source record: 277687

Hi,

Anyone intersted in a controller program for FRG-9600 (and FRG-965) which will run in the background and includes a very
simple but enhanced serial interface circuit, e-mail me.

381. tracking cell phone

Newsgroup: rec.radio.scanner
Date: 1994-01-16 14:34:33 UTC
From: asirene@ntuvax.ntu.ac.sg
Message-ID: <1994Jan16.223433.1@ntuvax.ntu.ac.sg>
Source record: 277688

Hi,

I've been following cell phone for some time and noticed
that every once in a while, the connection will change frequency. I
suppose this is to defeat listeners trying to follow the conversation
or that the user has moved to a new cell. My question is, is there
a way to track either of these situations? When the frequency is
changed, is there a pattern to it? Does it change to another freq
in the same range or ....? Tks. Very curious.

382. Re: NJ State Police Frequencies

Newsgroup: rec.radio.scanner
Date: 1994-01-16 16:52:21 UTC
From: <>
Message-ID: <CJqEvA.9B4@walter.bellcore.com>
Source record: 277728

7schlitt_s@spcvxb.spc.edu asks:
>> I was wondering if anybody knows the frequencies used by the
>> New Jersey State Police for the Newark and Totowa barracks.

These are the ones I use. They seem to cover Totowa mostly.
I can't remeber where I got them (Steven Jackson?).

0856.4625 nj state police / north / troop b / trunked
0856.9625 nj state police / north / troop b / trunked
0857.4625 nj state police / north / troop b / trunked
0857.9625 nj state police / north / troop b / trunked
0858.4625 nj state police / north / troop b / trunked
0858.9625 nj state police / north / troop b / trunked
0859.4625 nj state police / north / troop b / trunked
0859.9625 nj state police / north / troop b / trunked
0860.4625 nj state police / north / troop b / trunked
0860.9625 nj state police / north / troop b / trunked

A '2006 follows the trunking jumps just fine (usually the system
seems lightly loaded). They must also have a healthy repeater
as I hear calls from pretty far away from time to time.

BTW, anyone know what freqs the Netcong barracks uses? I only
hear "radio check" replys from Totowa on this set of frequencies.

>> Another question, is it possible to recieve the air phones that company
jet
>> use and if so the what are their frequencies.
>> thanks

> Yes, they are in the civil aircraft band and are FM instead of AM.

I think we are talking about two different things here and the above
response is wrong no matter which one it is.

ALL aircraft related transmissions in the "civil aviation band" are FM,
regardless of usage.

If we're talking about airphones, they are in the 800 MHz band and use SSB
or ACSB mode.

385. 8ch/sec -> 100ch/sec

Beware of overheating the CPU. They are REALLY expensive to replace
(meaning you might as well buy another scanner).

This usually happens when moving to an adjacent cell, and the frequency is selected by the computer controlling the system. It is possible to decode the digital burst which occurs just before the change, and build a receiver which "mimics" the phone, but you need the electronic ID of the phone. Boxes which do this are (illegally) sold, and are available to law-enforcement agencies legally, for use under a wiretap warrent.

Richard

387. Re: Can Scanners Receive TV stations?

Newsgroup: rec.radio.scanner
Date: 1994-01-16 21:03:38 UTC
From: henke@grumpy.ssc.gov
Message-ID: <HENKE.94Jan16150338@grumpy.ssc.gov>
Source record: 277691

In article <edgrantCJp2J5.C5t@netcom.com> edgrant@netcom.com (Edward L. Grant Jr) writes:

>Can scanners receive TV stations?

It depends on the scanner. To receive TV, the scanner must cover the correct frequencies (listed below). Also, if you want decent sound quality, your scanner must have a wide-band FM mode. (I use an Icom IC2SRA, and it works fine for TV audio.)

> If they can, could you give me the frequencies that they are found on.

Yes. Here are the frequencies for the United States; I don't know about other countries, save that many use a different allocation.

All are wide-band FM. All are in MHz.

59.75 TV-2
65.75 TV-3
71.75 TV-4
81.75 TV-5
87.75 TV-6
179.750 TV-7
6.000 MHz spacing for TV-7 through TV-13
215.750 TV-13
475.750 TV-14

388. PRO-46 mods for cellular?

Newsgroup: rec.radio.scanner
Date: 1994-01-16 22:50:16 UTC
From: sillett@edc3.gsph.pitt.edu
Message-ID: <12109@blue.cis.pitt.edu>
Source record: 277692

Are there any mods to restore cellular coverage to the Radio Shack
PRO-46 scanner? I see in the Sunday paper that it's on sale this week
and am thinking of picking one up, provided it can receive cellular.

Thanks.

Is the $50 FCC database on disk from Grove any good ? is it up-to-date ?
can I use it on a macintosh ?

please email responses if possible.
thanks in advance

jerry

390. 4 Sale: PRO-46 w/ cellular mod

Newsgroup: rec.radio.scanner
Date: 1994-01-17 00:07:37 UTC
From: rake@kuhub.cc.ukans.edu
Message-ID: <1994Jan16.180737.57275@kuhub.cc.ukans.edu>
Source record: 277695

I've got a PRO-46 scanner that I'd like to sell for
around $220. Coverage of the cellular frequencies has
been restored to this hand-held scanner. A local electronics
repair shop did the modification for me, and they did a nice
clean job.
Send me some e-mail if you're interested.

Hello!

Sorry if I'm beating a dead horse one more time...
Can anyone tell me who manufactures the PRO-46 for Radio Shack?
Has a review (ala Bob Parnass) or any mods ever been posted here?
I'm considering one as a replacement for an old PRO-30, so any
comments regarding quality would be greatly appreciated.
Thanks!

the RS discones are trash. i have an icom AH7000 in my apartment and it runs circles around all other wideband antennas i have ever used. great for 800MHz too. i heard the other great discones are diamond's discone and i hear that grove's isn't too bad. the RS discone has no vertical radiator / element which makes reception of everything below 120MHz almost non-existant.

Thanks for all recommendations. LL Bean is out of stock, and the smallest of the Radio Shack weather radios seemed like a reasonable deal at $20, so I went with that. Reception is fine (two frequencies clearly audible here) and it's small enough to carry around easily in a pocket. It doesn't look as rugged as the Bean model, but should be fine for home & office use.

Well a complete list of Massachusetts Frequencies would be too much
to publish here! A EXCELLENT reference for Massachusetts frequencies
would be the SCANNER MASTER Communication Guide, 5th edition. This
book is newly published and has a wealth of info on all aspects of
Massachusetts communications systems. You can call:

SCANNER MASTER - 1-800-722-6701

to order a copy. They are based in Mass and have an excellent ship time.

For Sudbury, Here are some of the more popular Public Service freq's:

Police 867.9125
Fire 33.980 (Southern Middlesex Fire Network)
Fire 33.740 (Fireground, furure primary fire channel)
Highway 156.195
Parks 154.115

Achtung! Achtung!

Announcing Issue 4 of ENIGMA
============================

ENIGMA is the newsletter of the European Numbers Information Group
and Monitoring Association and is essential reading for anyone
interested in the so-called "numbers stations" prevalent on shortwave
radio.

Issue 4 is packed with news and features about the numbers station
scene including:

* 8 pages of up-to-date station news
* Detailed Station Features on:

- "The Three Note Oddity"
- "Single Letter Beacons"
- "The Counting Stations"

* Latest transmission schedules
* Latest frequency information

The ENIGMA Newsletter is free of charge from the author:

Chris Midgley
195 Roberttown Lane
Roberttown
Liversedge
West Yorkshire
WF15 7LE
United Kingdom

Please enclose return postage if in the UK or sufficient IRCs
(International Reply Coupons) or a small donation to cover costs if
you are outside the UK. Please note that ENIGMA is not yet available
electronically. Please do not send any envelopes with your letter
(ENIGMA tends to change paper size often!).

Back issues of ENIGMA Newsletters 1, 2 and 3 are also available.

Requests for Information
========================

We are also requesting information on the following topics for
inclusion in ENIGMA No.5:

- your numbers station logs
- information about the "Foghorn" on 4625kHz
- reports and information concerning the German Gov't station DEA47

ENIGMA has contributors and monitors throughout the world - not just Europe - and we are always interested in numbers stations activity in other countries. Please send your reports by post to Chris at the address above or to me via Internet e-mail (mikec@praxis.co.uk).

the radio shack is made of stainless. i've had mine mounted 10 feet above the top of my chimney since mid '89 with no problems here in wisconsin where the temperature tonite will hit -20F with wind chill of -65F. i find it to work fine for me on vhf low band. use it for ham work also, does great for packet and fm voice. take your catalog coupon in and try it, 30 day return policy in store. <<standard disclaimer should be here>>.

Radio Shack's are OK. I have had one for several years and it works fine.
Be sure to get one with the Alert feature.

412. STANDARD CCR708A Info/opinions wanted.

Newsgroup: rec.radio.scanner
Date: 1994-01-17 23:30:10 UTC
From: galen@picea.CFNR.ColoState.EDU
Message-ID: <CJsryA.1C1B@yuma.ACNS.ColoState.EDU>
Source record: 277729
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment,sci.electronics

Well, I tried the Ace AR2500 and was sadly disappointed. I'm primarily
interested in RF spectrum analysis but not as extensive as FFT's and such.

The Standard CCR708A looks like an interesting receiver/spectral display
that would satisfy my current needs.
Has anyone out there bought one?
How good is the display/resolution/dynamic range/overall quality?
Is it worth the money?

I've called Std. and they're sending me info, but I'd like to hear reality.

Short spec list:
50-905 MHz, am/fm/wfm, 100 ch mem, direct freq entry,
spectral display, sugg. list $750.

Post 'em if ya got 'em,
Galen, KF0YJ

413. Re: New Jersey State Police freqs

Newsgroup: rec.radio.scanner

From: jackson@cs.nyu.edu
Message-ID: <2hfgof$jqd@longlast.cs.nyu.edu>
Source record: 277747

Yes, the frequencies listed were correct. However, the sequence is
everything. The frequencies are:

860.4625 859.4625 858.4625 857.4625 856.4625 -and-
860.9625 859.9625 858.9625 857.9625 856.9625

The order listed above is the order in which calls are handled by
the trunking system, provided the next channel in the sequence is
not a) already in use, or b) a control channel. Calls heard on the
856.XXXX entry will be answered on the 860.XXXX (or first available)
entry of the OTHER LIST.

I have been working on identifying the different types of transmissions that
can be heard on the State trunked system. The following is a summary of what
can be heard on these channel groups and do not apply to the other findings
of the other channel groups.

These frequencies seem to be a combination of the Troop B and Troop D barracks.
Troop B handles the non-Turnpike north barracks and Troop D handles the
Turnpike barracks. There are multiple dispatchers that work these channels,
and there does not seem to be any coordination between them. First, the
"Com" dispatchers seem to work three distinct areas of the northern section
of the state. I have monitored calls from "3-Com" (like the Ethernet card),
"4-Com", and "5-Com". The channel groups listed above are split into
subgroups that do not seem to have the ability to hear one another. I have
not been able to truly mark off where one Com dispatcher's zone ends and
another begins. The non-Turnpike units' default East-West roadway is Route
80. They usually specify the route number otherwise.

Then, the Turnpike units that use this channel group all seem to use the
"Newark" dispatcher. You can tell the turnpike units when they give their
locations and use such abbreviations as "NSI", "SNE" and others similar
in style. Also, you'll only hear northbound and southbound directions
from them.

Next worth mentioning is Operations. This seems to be some kind of
Big Brother thing NJSP has going that only talks to dispatchers. They
seem to hand over calls that come in from the general public. They also
handle calls between barracks that can't hear each other even though
they unknowingly share the same channel groups! Some design flaw, Motorola.

The next most common dispatcher seems to be REMS (spelling and naming
convention would be appreciated) which handles all communications for
Northstar, which uses these channel groups for current location and
occasional patient reports.

And finally, I heard for the first time when the Giants hosted the Cowboys a dispatcher that went by the name of "Stadium".

Don't get nervous when they "go car to car" or "switch to five", becuase while the troopers can only hear what the control computer decides they can hear, all transmissions sound the same to us. In fact, all too often you'll hear troopers trying to contact a particular location without success since they are on the wrong subgroup.

As a side note, I never monitor any other agencies while monitoring state only because of the trunked nature. I also make sure that 154.680 SPEN 1 is included in the scan in case any interagency coordination is needed when I'll switch to local agencies. You'll recognize SPEN transmissions since most of them end with rapid DTMF tones that sound the same no matter what agency transmits. It's great for those of us that scan by ear.. you can instantly tell when interagency comms are going on just by how the xmission sounds at the end.

For those who don't or can't monitor NJSP but are glad to know that the mysterious call sequence has been cracked, I looked closely at a picture in that Popular Communications article focusing on monitoring NJSP and saw Motorola and System 9000 on the radio in the trooper's car.

Good luck and happy monitoring.

I am looking for digitally recorded (.wav preferred) and uuencoded transmissions from the quake today. I will be visiting there in May and like to sample comms from areas before I get out there so I'm not taken aback by the different style. If anyone can help, please just dump it on me.. don't even ask if I still want it ;-)

Thanks..

Steve

For what it's worth, here's what I have for Arlington Co PD:

453.825 Ch1 Dispatch
453.500 Ch2 Car-to-Car
453.275 Ch3 Tactical
453.325 Ch4 Administrative
453.300

The only channels I have ever monitored are 453.825 and
453.500. I have no idea what 1B's frequency is. Good luck!

Now what does this really tell us? Not a whole heck of a lot! What don't you like about it? What features do you think it's lacking? Do you actually have one? Have you even played with one?

The original poster asked for 'informed opinions'. Yours is certainly lacking in content. I feel like a 5th grade school teacher trying to drag an answer out of a student.

Anyways, I'm in the market for a scanner. I'm looking at the 8500 as well. I need CTCSS capability, 200 channels, 800mhz capability (cellphones would be nice but not necessary). Any suggestions. I've currently got a BC760 and BC590.

Next morning adjustments:

In an article I wrote before going to bed last night, I wrote:

|> You can tell the turnpike units when they give their locations and use
|> such abbreviations as "NSI", "SNE" and others similar in style.

Last night, I heard three letter abbreviations used on Route 78. They either ended in "L" or "X" for local and express lanes.

|> Next worth mentioning is Operations. This seems to be some kind of
|> Big Brother thing NJSP has going that only talks to dispatchers.

I did hear Ops converse with a 5-Com car last night.

|> And finally . . .

I didn't mention the fact that you will occasionally hear stations calling units directly, as in "Somerville to 453". For the person asking, I heard Netcong in this fashion.

|> the troopers can only hear what the control computer decides they
|> can hear . . .

based on, of course, how the troopers select what subgroup they are participating with on their radios.

Troop C, central division uses 860-857.2125 and 860-856.7125. Since 856.2125 is actually missing, I am trying to figure out where 857.2125 is handed off to. So far, it looks like 860.7125.

As far as the LA stuff goes, I'm still looking for communication styles and details for LAPD and LAFD, including hot freqs and what to expect to hear.

Thanks..

>> Northern New Jersey would also be greatly appreciated
> According to a recent article in "POP COMM", NJSP is
>using 800MHz TRUNKED systems state-wide. This can present some
>interesting scanner challenges. They are operating 866-869 and
>935-940.

Let's see if I can get this correct...

Troup A, South Jersey: I forget.

Troup C, Central Jersey: 860.7125, 859.7125, 858.7125, 857,7125, 856.7125
860.2125, 859.2125, 858,2125, 857.2125, 867.2125
Troup B, North Jersey: 860.9625-856.9625, 860.4625-856.4625

One should scan the freqs in the order show above. The NJSP systems
use two blocks of five freqs. The transmissions cycle through the block in
high to low order and then switch to the top of the other block.
The control channel typically changes shortly after midnight so one must
lock out the new control channel and unlock the old one.

Also note that the low freq in the xxx.2125 block is not 856.2125. That
freq is replaced with 867.2125. It behaves just like one would expect
856.2125 to behave.

One disadvantage of discones is that their reception (radiation) pattern has lobes that increase upword with increasing frequency. So at the antenna does not receive or transmit as well on higher frequencies because the lobes are not along the horizon. But keep common sense in perspective here. The antenna is still a good performer for wide band operation.

My organization, Carnegie Mellon University Emergency Medical
Services is selling 3 Motorola P-100s V2 VHF handhelds. The freq. range
is 150.8 to 162 They have 1 watt(Low) and 5(High) watt outputs. Each
radio has 2 channels, with digital private line, duckie flex antenna, 1
battery that is 6 months old and another battery that is 2 months old.
Each radio comes with a holster to put on ones' belt. The radios were
purchased 4/16/91, I still have the original invoice. These radios are
presently in service and all in fine working condition. One radio had a
circuit board replaced 1 month ago and a new case was put on another 1
year ago. Other than that, only reprogramming of frequencies has been
performed on these radios. Each radio set(radio,charger, holster,2
batteries) is going for $350 each. You can buy one,two, but preferably
all three radios.
In addition, we have 5 earphones specially designed for the P100.
These earphones are 10 months old. Each earphone is being sold for $20.
These radios are not in bad shape or worn-out by any stretch of the
imagination. We are being offered a chance to upgrade.

Any questions call 412-862-2815 or email me at jmb2@andrew.cmu.edu

James, I'd like to add a small note:

Excerpts from cmu.student.amateur-radio: 18-Jan-94 SALE 3 Motorola
P-100s by "James D. Mason Jr."@and
> My organization, Carnegie Mellon University Emergency Medical
> Services is selling 3 Motorola P-100s V2 VHF handhelds. The freq. range
> is 150.8 to 162 They have 1 watt(Low) and 5(High) watt outputs. Each

There's no Amateur band between these frequencies (151-162MHz), but
they are very nice and very rugged radios, and if the purchaser can get
ahold of a public service or business band license, they'd be perfect
for outdoor events. (business band shouldn't be that difficult).

Just my $0.02

misc.emerg-services,misc.forsale,rec.radio.scanner,cmu.student.amateur-radio,rec.radio.shortwave,rec.radio.swap,cmu.cs.market

On thye way to work today (1/18/94) I heard a report on my radio (WCBS AM) that a HAM had predicted the LA quake on the weekend before it happened. They said he had faxed the prediction to news organizations, however, since he had made a prediction in the past that did not happen the news organizations (CBS?) ignored the latest fax. They mentioned he had some sort of equipment he used to help predict a quake.

The significance that he (they said "he" not she) was a HAM was not reported. Perhaps it relates to radio energy that rocks generate under pressure (I think the Nova TV show reported that phenom).

Does anyone have the full report, the fax prediction, or other details on this? Sounds like it would make a good Quirks & Quarks (if he was Canadian maybe ;-).

There is a guy in the Bay Area (California) with the last name of Cole
that predicts earthquakes by listening to HF or VLF frequencies on a
receiver. I don't know if he is a Ham or even the person the news
was referring to, but my guess is that it was him. I met him once and
he was a bit eccentric. Most experts have dismissed his predictions
but he HAS predicted a few correctly. He says that he can hear
fluctuations of radiowaves on his receiver, weeks prior to an earthquake.

Very few "earthquake predictors" are taken seriously.

I've read that Stanford had an Ultra-Low Freq receiver near San Fran when they got the shakes, and it registered large swings for 30-40 hours before the quake. The receiver was intended to examine changes in the geo-magnetic field, but picked up the piezo-electric radiations of the rock strata as they were under increasing stress. The output was swinging wildly, then went flat when the power went off.
There's an amateur group that publishes a journal of this sort of thing, but I can't remeber their name.
I'll dig out an issue when I get home.
galen, KF0YJ

>maybe ;-).
>
> Pete Costello

Discussion is going on in ca.earthquakes of a claim that Jack Coles
predicted the quake the weekend before it happened. However the exact
details of his prediction have not been posted. He has made other
predictions in the past which have failed to happen.

I don't speak in an official capacity. The Stanford work by Tony Fraser-Smith was an chance finding. He saw an increase in emissions in one ULTRA-low Freq band (while doing a study for the Navy) a month before the Loma Prieta quake. Several hours before the quake, there were emissions in slightly higher ultra low freq bands. Keep in mind that the antenna was 5 kilometers from the epicenter. That's very close.

The other earthquake "predictors" do not look at the ULTRA-low freq that might predict an earthquake and their antenna is not sitting right on top of the epicenter.

In the Albany, NY area, that'd be 87.7 MHz, where you can hear Dan Rather on weeknights, and recently, "TV's best coverage of the Los Angeles earthquake," as he so eloquently put it...:)

Is there some kind of noteworthy disaster that that man DOESN'T go bananas over?

The only true weaknesses of the Uniden scanners (i.e. 8500, 2500, 890 etc.) is their poor selectivity and image rejection. The features they offer are about as much as you can ask for (without computer control).

I admit that selectivity and image rejection are pretty major problems, but keep in mind that these can be offset by the use of the CTCSS option and will not be major problems for those living in rural areas where strong RF signals are not as abundant.

Three of my scanners are Uniden (2500, 760, 210xl) and they all have their strengths and weaknesses. There is no perfect scanner out there. I also have two Icom scanners, a Pro-2005 and several others. They all have tasks that they perform well and all have tasks that they don't do so hot. I don't think Uniden deserves to be bashed any more than RS, Icom or any other manufacturer. Uniden scanners have the most simple user interface of any programable scanner I have seen. They also are tops for sensitivity (to a fault, without selectivity).

If you plan to use the CTCSS board, and like the Alphanumeric display, then go for the 8500.

445. Re: New Jersey State Police freqs

Newsgroup: rec.radio.scanner
Date: 1994-01-19 02:05:31 UTC
From: amullick@vaxc.stevens-tech.edu
Message-ID: <1994Jan18.210531.1@vaxc.stevens-tech.edu>
Source record: 277576

In article <2hfgof$jqd@longlast.cs.nyu.edu>,
jackson@cs.nyu.edu (Steven Jackson) writes,
is regards to the NJ State Police Trunked Radio System:
> The next most common dispatcher seems to be REMS (spelling and naming
> convention would be appreciated) which handles all communications for
> Northstar, which uses these channel groups for current location and
> occasional patient reports.

REMCS is the Regional Emergency Medical Communications System and is
based out of University Hospital in Newark, NJ. In addition to NorthSTAR
dispatches (on 155.295 - "295"), they also dispatch ALS and BLS units in
and around Newark, and University Hospital's Mass Casualty Response Unit.
(ALS pages are on 295; two-way ALS & BLS communication on 155.400 - "400"
-- ALS units are referred to as 2xx or MIC-xx, where 201 is MIC-1, etc.;
BLS units are referred to as 1xx; the MCRU is 301).

NorthSTAR usually uses the Troop B frequencies ("800") for two-way
communcation using 295 as a pager channel only, though recently they have
been having problems with their 800-MHz radio and have been using 295 or 400.
NorthSTAR is equipped with radios ("RT"s) for air-to-ground communications
on any frequency.

Additionally, a cellular telephone is available on board for the flight
crew's use to contact Medical Control (while still on the ground scene).
Once in flight, when in a rush, or when the cell phone misbehaves, REMCS
will coordinate phone patches for NorthSTAR using the trunked radio system.
Medical Control is usually a trauma surgeon at University Hospital regardless
of where NorthSTAR is flying to, though occasionally a doctor from another
trauma center (including Morristown Memorial, Robert Wood Johnson, Hackensack,
and Jersey Shore) or a resident from University's ED is used.

Coincidentaly, REMCS has been having communications problems on 400, and has
been using JEMS 4 (153.785 - "4") as a secondary dispatch channel.
The NJ EMS (JEMS) Coordination freqencies are (1) 155.400, (2) 155.340,
(3) 154.280 and (4) 153.785. JEMS 2 is more commonly referred to as the
HEAR (Hospital Emergency Administration Radio). REMCS monitors all of JEMS
as well as the State Police Emergency Network (SPEN), channel 3 (153.725).
FWIW, SPEN 4 is the same channel as JEMS 4.

This is a periodic reminder that the Boston Amateur Radio Club maintains an FTP area on world.std.com (192.74.137.5) in pub/hamradio.

This area is accessible via: anonymous ftp, gopher, and World Wide Web (and possibly other methods I'm not yet aware of). World is not *fsp*-able yet (I asked them).

Via Gopher, the easiest path to the area is by selecting the following from World's main menu:

18. Membership and Professional Associations

3. Boston Amateur Radio Club

And go from there...

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail me.

Also, up-to-date copies of the files on the ARRL's information server (info@arrl.org) are available in the directory pub/hamradio/ARRL/Server-files.

All text files are uncompressed, so they are both retrievable and viewable via Gopher and World Wide Web. (If you have any troubles with any text file, please e-mail me).

Source code for programs is always welcome. It can permit people to use those programs on other computers with other operating systems.

Scott

>Could someone explain why a 230kHz +/- 2kHz FM intercom which uses house
>wiring apparently receives and transmits to a cordless phone in another
>building? It has happened on occassion. It is a Radio Shack intercom.

Hmmm. 2 * 230Khz = 460Khz which is close enough to the 455Khz IF
frequency of the cordless phone to interfere.

Incidentally, if your cordless phone is on channel 4 (49.770Mhz),
then the 3rd harmonic of the local oscillator in the base unit
lands on 147.945Mhz and will obliterate that frequency. Another
bummer is the 41st harmonic of the color burst clock freq.
41 * 3.579545Mhz = 146.760Mhz.

The "prediction" was from Jack Coles of San Jose. The wording I saw quoted
was pretty vague. I don't think he is a licensed ham, but he (and a lot of
ther people) have been monitoring electromagnetic phenomena that they believe
may be correlated with earthquakes. There are several groups of
researchers around the world working on this, based on the theory that
in the pre-quake period, there are stresses and movements that generate
electric potentials or change resistivities of different rock strata,
and that there might be surface-detectable electromagnetic phenomena to
go along with it. No one knows what the mechanism is for sure, there are
a lot of almost plausible theories but a lot of the experimenters in this
field, including Coles, have chosen to keep their methods secret. Unfortunately
there is a really hostile attitude toward most of this work from the
traditional geological/seismological community, which tends to discourage
people from disclosing methods that even they don't understand fully. USGS is
working on one aspect, with some magnetometers installed in the Parkfield
(seismically active) area to look at this phenomenon, Tony Fraser-Smith
of Stanford has been working on it, with papers published at AGU meetings,
Jack Dea et al of the Navy (NCCOSC San Diego) published a paper that has
some interesting data in it. Coles believes he is a little closer to being
able to "predict" which I guess pushes him to send faxes to news organizations;
however he and the other undisclosed-theory observers don't have a very
good success rate yet.

> Does anyone have the full report, the fax prediction, or other details
>on this? Sounds like it would make a good Quirks & Quarks (if he was Canadian
>maybe ;-).

The only excerpt I have seen is the following, sent to a Well subscriber
on Saturday night:

"Reports are coming in from all over the bay area and southern California
of increased radio signals...results could mean a quake greater than six

points...another set of smaller signals happened on Jan. 13, 1994 at 12:m. These signals were small and may reach a 3 to 4 on the scale during the next 96 hours. The location of these signals were toward Southern California and may be felt in Los Angeles."

When we get to the point of being able to observe "the signals" and know what we're talking about, then maybe there will be more rational discussion and less polarization between either "he's nuts" or "he's magic."

There is a magazine on this topic published by Vince Migliore called Geo-Monitor, you can reach Vince at glyph@well.sf.ca.us.

Cheers

459. New Scanner Master for MA??

Newsgroup: rec.radio.scanner
Date: 1994-01-19 13:56:53 UTC
From: slitel@cadre.com
Message-ID: <1994Jan19.135653.28295@fripp.ri.cadre.com>
Source record: 277669

A while back there was some talk re: the New Scanner Master for Massachusetts coming out and it would have all the information relating to the Mass. State Police and their going to 800 band.

Did anyone or has any one picked up the book yet. If so, please share the information to all.

Anything on the new Mass. State Police would be helpful. It seems as though most of the troops except for Troop E (Turnpike) are not used. I drive on the highways of Mass betwen 1 - 2 hours a day and my scanner picks up nothing except the Troop E guys and a RARE mumble on other SP frequencies.

Also anyone know the frequence for the new traffic system Smart Routes (or Smart Traveller)?? Since this has popped into service, the other traffic guys have gone very quiet!

Please Post for all to see...

Stuart Litel

Because it assumes you wish to listne to cellular traffic, which in the
USA are assigned to channels with 30 KHz spacing.

> am i missing anything?

Anything which does not conform to the above, such as cellular traffic on
other continents.

>Just what do I get if I buy this?

You can buy a subsciption to 'Geo-Monitor'. A few years back I received some sample issues that I dug out on Monday.

There are two people mentioned in G-M. Jack Coles of San Jose uses a spectrum analyzer tuned to 10.33 kHz with a 2k bandwidth. Joe Tate confirms Coles' findings and has a system that examines three bands: 0.2 to 1 kHz, 1 to 10 kHz, and 10 to 100 kHz. Tate's work is so convincing, the U.S. Geological Survey granted him a contract to set up monitors along California faults.
The article concludes with the statement that 'Several amateur researchers and a growing number of pro scientists agree that 'something funny is going on' with regard to earthquakes.'

In the column next to the Coles-Tate article is an article by psychic the Rev. Linda Schiller, who predicts an earthquake in California 'around Christmas or early January 1994'.

From the September, 1991 issue of 'Geo-Monitor'

Geo-Monitor
65 Washington St. #400
Santa Clara, CA 95050
1991 sub. price was $18.00/yr in U.S.

I present this information, but I do not agree or disagree with it. You Decide.

A discone antenna is a vertically polarized antenna which shows a very
wide bandwidth from a low frequency which depends upons the physical size
of the antennna to a very high frequency.
My Radio Shack discone seems to exhibit an SWR under 1.4 to 1 from about
90 megacycles through 1200 megacycles, the limit of the SWR measuring
device I borrowed. I
I only use mine for two meter packet, and at times for my vhf/uhf scanner.

Hello again,

I took the advice of everyone who replied to my message about
having the aor-1500. I took it back and am now in the market for
the MVT-7100.

The problem is that ACE communications is the ONLY US
distributer that I know of and they have a 14 week wait. And
theres are cell locked...

So I was wondering, does anyone know another place I could get the
MVT-7100 in the US.??

I know about javiation, in the UK, But Im worried about having service
done to the reciever after the april 26 deadline...

By the way has anyone done a good deal of business with javiation
they seemed to on the up and up...

Any info would help thanks,

|> BTW:Anyone know what frequency do cellphones _transmit_ on????

Our 800MHz band plan states that inputs are 45MHz _below_ the outputs. That's why when you have long lists of frequencies that part of a trunked system, you generally only hear things on half of them. I've also seen UPS and FedEx (possibly) follow at approximately 39MHz down in the 900MHz range.

Who makes up these splits?

Countless people on CompuServe, Genie, and the Internet have bought Yupiteru scanners from Javiation (Jonathan Clough). Many of us now consider him to be our friend. While a small business, his is legitimate, honest, and well-regarded. I understand your concerns (above) but unfortunately have no answer for what will happen after April. Why not give him a call (fastest way) and get his opinions.

NEW TECHNOLOGY

I'd like to tell you about a new FM, AM/Stereo Walkman that has just come on the Market from Sony. This Radio does not have either a tape deck, nor a speaker in it and is almost Credit Card size. It takes 2 Pen Light Batteries and plugs in to a standard set of Walkman Earphones.
The radio has a Slide On/Off switch located on the front of the set. On the Right side of the set is a slide switch.

Nearest the top of the unit the setting is FM which is full Stereo. Moving the switch down one notch is AM/Mono and moving the switch to the bottom produces AM/Stereo. On the top Back right of the set you will find the tuning dile and on the left side you will find the Volume control. The Jack for the Earphones is located on the top left of the set and on the back of the set you can install the snap on belt clip. At the bottom of the set on the rear is the battery compartment.
This unit uses a New Motorola Chip and I Purchased it here in The Bay Area from I.R.T.I. which is located in Mountainview, Ca. The price is $32 pluss $2.39 for shipping via U.P.S.
There are several stations broadcasting in AM/Stereo and I find the Stereo to be reasonably True on AM. As the Decoding is diferent on Am compared to FM the sound of the stereo is slightly diferent but it seems to be reasonably accurate. The Model number of this unit is SRF42/BM and I encourage you to Purchase this newest Technology. I found it's performance excellent on AM and FM.
I assume that Sony dealers can get this set for you but you may order the set through I.R.T.I. at either (415) 961-3161 or (800) 322-4784. If you order this interesting Technology I'd be interested in your comments and if you call I.R.T.I. to order, Please let the friendly person you talk with know that you heard about this unit from Don Coco in Oakland, Ca. I am a totally blind person and whenever new interesting technology comes along I try to buy it and let you know my observations about it. I do not work for I.R.T.I. but have done business with the owner, who is a blind person himself and who sells fine Electronics for people, since 1990. May you become the first person on your block to Tell your Neighbors that you can listen to AM/Stereo.

Hi, Steve...
I didn't purchase one because of the problems I have read about on CompuServe. The two major complaints are poor sensitivity and lots of intermod. I heard that the BC 760 is a good unit. Someone on CompuServe had one for awhile. The 760 has CTCSS capability. However, I believe Uniden said that not all of the frequencies are covered with the CTCSS board. Maybe someone could fill in the blanks on this.

Source record: 277638

s> I have purchased a Radio Shack Pro-46 this last weekend and would like
s> anyone who has information on mods to extend coverage or improve scan
s> speed to let me know what the changes are. Thanks in advance for your
s> information.

Hi, Steve...

Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

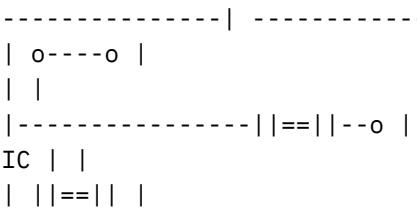
The modification of this unit is from the May, 1993 issue of
Monitoring Times, published by Grove Enterprises.

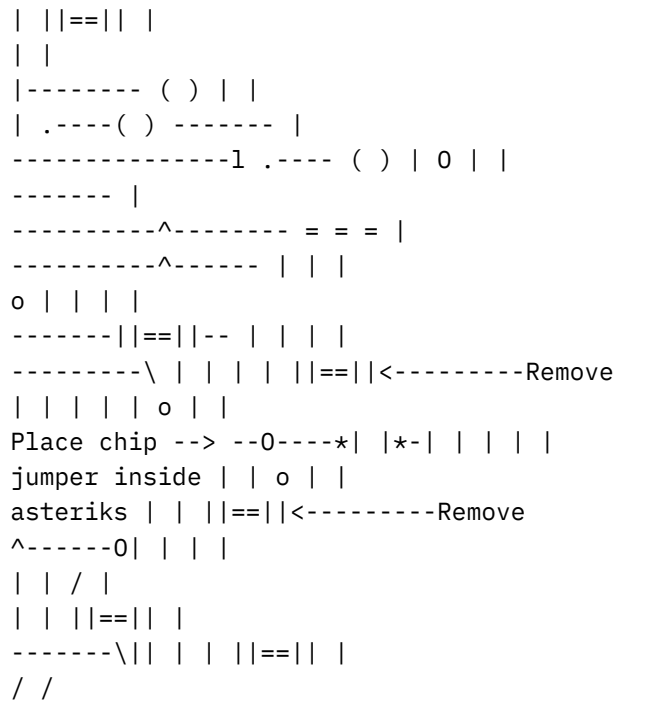
** Disclaimer: All modifications are done at your own risk. This
product uses surface mount components which can be easily damaged.
Do not perform this modification if you are not experienced with
this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted
by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping
available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then
push upward on the bottom of the rear of the case, carefully
swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards
next to the interconnect plug in the lower right corner. Gently
pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor
and set it aside. ** CAUTION!! Too much heat will damage the
shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder
and remove both.
6. Solder one chip jumper across the two upper most unused solder
pads. (Soldering a jumper across the lower two pads changes the
30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.





Enjoy...Jerry...Chicago

Cross-posted to: rec.radio.scanner,cmu.student.amateur-radio,rec.radio.shortwave,misc.emerg-services

They had a blurb about this guy on one of the stupid TeeVee rag-shows which I caught. In the interview he mentioned that he used to be a stereo repairman and noticed something on his 'scope about four hours before a quake, and started watching for it.

While not radio oriented, it's been widely discussed by cat fanciers that cats invariably seem know about a quake around 6-8 hours before it happens. Like dogs hearing supersonics that humans can't hear, I wouldn't be suprised that cats may be able to sense the same RF that Cole is seeing with his gear. I wouldn't write this guy off as a complete flake, especially since he seems to be interested in studying this in the same vein as weather forcasting.

Hey! I thought I'd jump in here. I've got a BC100XLT and know a little about the problems you're having. One thing, my BC100XLT has a lithium battery backup, but I don't think the earlier models do. If you put yours away for a long period without your nicad attached and it didn't lose memory, then you do have a lithium battery. Technically, if you disconnect the nicad, the memory will be lost in less than 30 minutes if it has no lithium battery. Now, for your low battery indicator. YES, there is a mod for that. I have it if you want it, it's really pretty easy. I haven't done mine because it's still strong and I like to know when I really need to charge it. I modified my BC100XLT in only one way, I added another 100 channels of memory for under $25.00, which I thought was well worth the price, making 200 channels of memory altogether. Another 200 channels can be added, but I opted not to go that far with it. Unfortunately, I did not get the entire thread and do not know what error message you were talking about or what you mean when you said something about it not searching anymore. Provide the data and I'll be glad to help if I can! :-)

c> range in 30mhz intervals? am i missing anything?

c> cali

Hi, Cali...
Do you mean 30 khz intervals? The typical channel spacing for cellular
phone channels is 30 khz. So, you aren't missing anything.

I responded to that item, to try to stop people from thinking that AOR AR-1000XLT he was selling was some sort of secret spy device, as the seller clearly tried to imply.

His price of $250 is OK, but the AR-1000 was never an outstanding radio, & there are a few out these days that are a lot better.

The AR-1000 is simply a commercial, broad-band handheld scanning communications receiver, commonly referred to as a 'police scanner.'

Well the FRG-9600 (and FRG-965 as it is sometimes called), can receive
not only the audio subcarrier of all TV channels but also includes an optional
US$20-30 module which allows viewing on a composite monitor. This is for NTSC
but can be used for ATV as well. Conversion to PAL is a trivial change of the
on board 4.5 mHz ceramic filter to a 5.5 mHz filter. The YAESU FRG-9600 has a
coverage of 60-905 typically but can be modified to cover up to 950 with no gaps
in between. A really cool radio.

I just noticed that PRO46 sold in Canada has freq ranges up to 956 Mhz (806-956) whereas its sibling in the States can receive freqs between 806 Mhz and 1126 Mhz. Anyone has any truth to this and are there any mods to restore the missing freqs?

Thanks,

Although this is only slightly related to radio...
In the case of dogs and cats, the have a concentration of a substance
called magnetite (sp?) in a frontal lobe of the brain. This substance
is highly magnetic. Scientists theorize that the fluctuations in the
earths magnetic field prior to an earthquake, cause slight pain in
some animals --they get a headache. Many animals have been observed to
try to sooth this pain by eating tree bark and plants that contain
natural pain killers. THis explains why so many pets run away or act
strange prior to an earthquake.

|> cats invariably seem know about a quake around 6-8 hours before it
|> happens.

I must say, I spoke with my sister in Los Angeles a few hours after everything settled, and she told me that the normally well behaving cats they have in the house were shrieking and fighting from midnight on.. very spooky

|> cats may be able to sense the same RF . . .

I know sharks can sense magnetism and electricity of living animals, but I doubt cats can sense _RF_ signals.. I know they can feel something in the air, but RF seems a little out of reach.

Can they or what?

```
FOR SALE:

Realistic Pro 30 Hand held scanner

Freq range
30 - 54 Mhz
108 - 136 Mhz
138 - 174 Mhz
380 -512 Mhz

This is a great full featured scanner.

numeric pad for entry
16 channels
backlit LCD
long battery life

includes service manual.

Price $65.00 or Best Offer

>Thanx,
>Michael

I didn't bought it in Japan (or anywhere else either yet! :)) but I would suspect, that it will have cell. frequencies eliminated for Japan market. Consider that.

501. rf460X (new amp) for sale

Newsgroup: rec.radio.scanner
Date: 1994-01-20 19:34:19 UTC
From: kirk@hpcc01.corp.hp.com
Message-ID: <71960004@hpcc01.corp.hp.com>
Source record: 277654

Brand new rf460x (Rockford Fosgate) amp....still in factory wrapper.
$250 or best offer.
I'll post the specs after the weekend, but leave it to say that
they've really improved it over the older rf460sd.

4x60 WPC .....
adjustable crossovers (HP, LP and none)
bridgeable
configurable

I got an a/d/s 6.25 for these features and it costs much more (my rf460sd
went out and they couldn't fix it so they gave me a new and improved amp)

502. AOR AR1000XLT vs. Yupiteru MVT-7100

Newsgroup: rec.radio.scanner
Date: 1994-01-20 19:40:46 UTC
From: baum@ukraine.corp.mot.com
Message-ID: <1994Jan20.194046.14316@lmpsbbs.comm.mot.com>
Source record: 277661

I am trying to determine whether the ~$600 Yupiteru MVT-7100 is worth the extra money over the ~$400 AOR AR1000XLT for a person that is not interested in listening to single side band. I realize that the Yupiteru has a much better user interface, but the AOR is fairly easy to use with some practice and the help of Howard Bornstein's (sp?) Guide to the AR1000. The sensitivity specs of the AR1000XLT seem to be better than the Yupiteru in most frequency ranges. How do these units compare in selectivity and in strong signal areas (dynamic range)? Any other areas of performance where the Yupiteru is clearly superior?

From: dbushong@wang.com
Message-ID: <CJyAAH.5Ew@wang.com>
Source record: 277657

The other morning the power went out about 6:20 a.m. while I was listening to 95.7 FM to see how bad the ice storm was (which, incidentally, was an answer in itself), so I thought "Well, let me take my little Icom R-1 and dial that bad boy up to 95.7 Wideband FM and finish the weather broadcast."

Hmmm.... which one of those *teeny* little buttons is the "9", the "5", the ".", the "7", and what button is the "mode" over? At least the display will light, so I could see how poorly my fat little fingers were doing.

Anyway, I got it (finally). They said that 65,000 New Hampshire customers were without power. I felt bad for the other 64,999 of them, but not too much.

So if you think you will be in such a situation with your scanner, either memorize how to do it, or rubber-band a teeny flashlight to it, and/or buy one that also lights up the keypad on command. My Alinco DJ-580 does that, plus it looks cool in the dark :)

Regards,
Dave

A TALE OF TWO SCANNERS

~~~~~~
The Pro 39 and the Pro 43: A General Comparison
by John Quill Taylor

~~~~~~

This is a general yet practical comparison between two popular Realistic(TM)
Brand portable scanners, the Pro 39 and the Pro 43. This is not an in-depth
technical comparison, as these have been written already. This is a
comparison from my own experience using both scanners. I've had a Pro 39
for seven months, and a Pro 43 was just acquired recently, so my report is
probably biased toward the Pro 39, with which I am more familiar.

Overall Impressions and complaints:
==================================

The Pro 39 & Pro 43 have some major differences and some subtle differences.
The subtle differences can be surprising. For example, the beep
confirmation tone is about one whole note higher in frequency on the Pro 39
than on the Pro 43! Also, each radio has its own "personal" behavior: the
quality (or lack thereof) of its sound, the brightness (darkness?) of the
internal lamp, and the ease with which you can read (or not read) the LCD
display, all vary between one radio and another, even of the same model!

In MANUAL mode, both radios have a STANDBY feature that allows the scanner to consume less power, Both radios go into STANDBY mode after about 5 seconds. The STANDBY circuit produces and audible thump in an external speaker. When using an AC adapter (either charging or powering), an audible hum is heard when using an external speaker.

What's GOOD about BOTH the Pro 39 & the Pro 43:
==========

Both of these radios share the same small footprint (more like thumbprint!). They use the same battery pack (6 AAs), AC and DC adapters (9V), and have a similar look and feel, including the antenna connector (BNC), earphone connector (1/8"), and squelch and volume knobs. Both radios can be modified to restore full 800 MHz coverage, and modifications exist to eliminate the beep and improve the sound.

What's BAD about BOTH the Pro 39 & the Pro 43:
==========

Although a modification exists to defeat the beep confirmation tone, a switch to enable or disable it would have been nice. The sound of the beep when using headphones or an external speaker is quite obnoxious, but the beep is somewhat useful during programming, since the buttons are rather small.

The belt clip is a piece of trash. Granted, it only costs a dollar to replace (at Radio Shack); I've spent three dollars more than I care to have spent on this weakly designed part. Luckily, its failures have not caused any damage to the radio itself, a very real possibility.

The internal speaker's in both radios suck.

On my Pro 39, I once was removing the batteries while the power was on, and I lost all the frequencies! I am unsure whether this can happen to the Pro 43, but I recommend turning the power off before taking the battery pack out and leaving it off until the pack is securely in place.

When in PRIORITY mode, the scanners often "leap" from a frequency with a solid carrier. Also, during the "sampling" of the priority channel, the radio often "misses" a pressed button, requiring you to press it again. These little "bugs" occur also on the Pro 2006.

What's GOOD about the Pro 39:
==========

The Pro 39 has a lower price.

The Pro 39 has a much easier to read LCD, at least on the radios I have seen. I returned my first Pro 43 because the display was hardly readable.

The Pro 39 uses less than half the current drain as compared to the Pro 43 (according to published specifications). This was my initial reason for getting a Pro 39 versus a Pro 43. Where does all that power go in the Pro 43? Is it the triple conversion? Is it the triple conversion? Is it the triple conversion? Who knows?

While the internal speakers are awful in both models, my Pro 39 has a much better sound. It is, in a quiet room, even "listenable." The Pro 43 speaker "cracks up" (this may be the fault of the audio amplifier, since both radios perform well with headphones or an external speaker).

The general "behavior" of the Pro 39 seems a bit more "positive" to me, although I have owned this radio much longer than my Pro 43. When scanning, pressing LOCKOUT works immediately on the Pro 39, while it seems to hesitate a brief moment on my Pro 43.

What's GOOD about the Pro 43:
==========

The Pro 43 has a few extra front panel features that are nice, like an AM/FM button. The Pro 39 "assumes" AM mode in certain frequency ranges, and this mode cannot be "overridden" with a button like the Pro 43.

The Pro 43 scans in both directions, from lower to higher channels (default "wakeup" mode, like the Pro 39) and also from higher to lower channels. This is a subtle but very handy feature that allows you simple way to "bounce" back and forth between two closely spaced "hot" frequencies.

The Pro 43 features triple conversion (versus double on the pro 39). I didn't think this was a big deal, especially if you live in a "little" town like I do, and I still don't think it's a big deal if all you do is scan the programmed channels. Where triple conversion pays off is during searches, but since neither radio has "frequency lockouts" during search mode, both radios will "hang" on dead carriers, birdies, etc. during searches.

The Pro 43 has a shorter antenna (about 1/2" shorter). It is also narrower (about 1/8" narrower).

The Pro 43 "remembers" the channels without batteries, although many times I have left my Pro 39 on all night (after the batteries expired) and the frequencies were still there. Maybe I am just lucky.

The Pro 43 has better frequency coverage (see the Radio Shack Catalog).

The Verdict:
==========

The Pro 39 is less expensive but it only uses double conversion. The Pro 43 uses triple conversion, and yet it uses more power, has a more difficult to read LCD, and sounds worse using the internal speaker. While some great discounts can be had on both of these radios, I strongly recommend holding and operating both radios side by side before buying, and, if I had to do it again, I would buy them in person, since it appears that each radio varies in its LCD display and sound quality.

513. Uniden (and Realistic) scanner mod info

Newsgroup: rec.radio.scanner
Date: 1994-01-21 03:00:43 UTC
From: BOZOBROWN@delphi.com
Message-ID: <940120.79243.BOZOBROWN@delphi.com>
Source record: 277665

Hi!

Please forgive the "form letter", but I've received several requests for info on the mods to the BC100XLT, so I thought I'd try to put everything into one message.

First of all, I'm not a tech. I bought a book that was listed for sale in the back of a 'Popular Communications' magazine. The book is entitled:

UNIDEN SCANNER MODIFICATION INSTRUCTION MANUAL
by B.H. Davis

The manual covers the following scanners: BC100XLT, BC200XLT, BC205XLT, BC580XLT, BC600XLT, BC760XLT, BC855XLT AND BC950XLT. It also covers the following Regency scanners: TS-1, TS-2, 4020, 4030 and R-1600.

I got the manual by sending a check in the amount of $14.00 to:
Starlite Mfg, Inc.
4424 Clemice Lane
Montgomery, AL 36106

Disclaimer: I am in no way, shape, form, or manner, connected in any way to this company, person, or persons. I blindly, based solely on a classified ad in 'Popular Communications', sent the check. About three weeks later, I got the book.

The mod I performed was relatively simple, mainly because of the photographs in the book. It made identification of the proper parts and installation points easy. Basically, the BC100 uses the same pc boards that the BC200 uses. Adding 100 more channels means that I just had to put in some of the components that Uniden left off to make a BC100. It does mean that you will have to purchase some parts, which I did directly from Uniden. The most expensive part was a memory chip, and the grand total, including shipping, was just over $20.00. As I look over the instructions, I really don't see how I can describe, using text, the process to you. The book shows a picture of a BC200 pc board, and has the proper locations circled which makes the entire process pretty easy. Since I'm not a tech, I can't put into words how to do it. It involves cutting a resistor or two, and adding a transistor, a resistor and an IC chip.

Other mods for the BC100 are scan speed increase (doubles the scan rate) and a battery mod to extend the battery time. Sorry, no cellular mod. The author says that although the same pc boards are used, the cost of the parts would make the mod sort of rediculous. These mods will work on a BC200, BC205 and the Regency 4020. Other scanners listed above are modified in the same manner, but listing them all here would take too much room here.

Another 200 channels can be added to the BC100 after the previous mod, and another 200 channels can be added to a BC200. It involves adding more IC chips, etc plus an external switch, so you can switch from one 200 channel bank to the other. It will not accept all 400 channels at one time, which is the reason for the switch.

Well, I feel like I've been of no help except to refer you to someone to send your money to, and I will take no responsiblity for it. Sorry. The only benefit you have that I didn't have, is that now you've at least heard of someone who ordered the book, and got it. Believe me, the pictures are the key to the simplicity. I've seen mods listed where they try to describe which jumper to cut, etc, and it made me very uneasy, considering the prices of scanners these days.

For your Realistic friends, a book entitled:

REALISTIC SCANNER MODIFICATION MANUAL

is available at the same address for the same price. I haven't seen this book, but I would think it's of the same quality as the one for Uniden.

BTW- The address and prices indicated above are from the September, 1993 issue of 'Popular Communications', in the classified ads on page 79. You may want to pick up a current issue and look to see if the ad is still running, and if the price has changed before sending a check or money order.

>find one of these lists? Thanks...

Try 35.02, 154.6, and 154.57. Thst should get most of them. Newer
McD's have typical 460 MHz Business band splits (12.5 KHz splits), which
you can search. Older units have carrier on all the time, newer ones only
work when activated. You'll find listening to both sides
of the conversation (35.02 AND 154.6) is interesting, as thay often have
internal conversations that are not sent out to the customer. Finally,
DO NOT try to buy a business band HT to talk to them...154.6 is
readil;y available on HT's...it cost one person big bucks!

73,

Wally Bloss

The Yupiteru is notoceably more sensitive across the board. You fill find,
often, that the spec sheets from AOR are rather optimistic. If I didn't
need sideband, I'd look at the Yupiteru MVT-7000 which is the older model.

518. Pro 2021 and D/FW freq list.

Newsgroup: rec.radio.scanner
Date: 1994-01-21 13:51:04 UTC
From: rgregory@adrs1.dseg.ti.com
Message-ID: <CJzFt6.Dnq@skopen.dseg.ti.com>
Source record: 277584

PRO-2021
========

I bought my Pro 2021 in '88 and now have a couple of comments/questions.

It will scan 30-54 / 108-136 / 138-174 / 380-512 Mhz

The Owner's Manual says:

"The tuning range of your PRO-2021 is permanently stored in
the microprocessor chip. There's no way it can be extended
or altered - even by a skilled electronics technician. So
if you try to enter a frequency not in the PRO-2021's tuning
range, you will get an error message every time."

Is this true? I want to "fill-in" the holes. Can I replace the
above "microprocessor chip"?

I have seen the "scan speed-up" mod, but I WANT MORE!!

D/FW freq list
==============

Soon after I bought my 2021, I found a list of local scanner frequencies
on a local computer BBS. Well, I have lost that list; it is probably
hopelessly out of date, anyway.

Does anyone know of a local (D/FW) BBS for that list? Do you have that
list? I tried to call the guy listed on yesterday's "SWL and Scanner Club"
list, but his number is unlisted.

I now yield the floor to the "master's of the air waves",

Hi,
I was trying to find a good source for cell phone mods or at least
newsgroups for that kind of discussion without much luck!
Anyone can advice me about possible sources for that?
I know about garfield.catt. It has something, but not much.
Mostly scanner/hamradio stuff.
I suspect, that there are a lot of BBS-es for that. At least in USA.
Anyone knows about BBS-es in Canada (Toronto: 416, 905 area)?
Thanks,

I just bought the Radio Shack CTR-22 on sale for $30. It does not have a mike in, but putting the mic in front of the scanner speaker worked for me. They also have a $40 voice activated recorder on sale that has a mic in and dual speed, but uses micro-cassettes. I think the sale is till the end of january.

HAMFEST CALENDAR 1993/4 - NORTHERN ILLINOIS
last updated December 9, 1993

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (708)979-5414, electronic mail: parnass@ih4gp.att.com.

JANUARY 1994

Jan 30, Sunday: Odeum, Villa Park, IL - Wheaton Community Radio Amateurs hamfest. Odeum Expo Center. 8 AM - 3 PM. Tickets $6 advance, $8 at the door. VEC testing. All flea market tables reserved. To reserve a table, call (708)231-2428.

(Note for Bell Labs folks: John Broughton has tickets. Call him at 713-4319 for info.)

FEBRUARY

Feb 20, Sunday: Rock Island, IL - Davenport Hamfest, QCCA Expo Center, 2621 4th Avenue, Rock Island. Admission $5. Info, SASE to Kent Williams, 4245 10th St., East Moline, IL 64244.

Feb 26, Saturday: LaPorte, IN - Cabin Fever, LaPorte Civic Auditorium. LaPorte Amateur Radio Club. 8 AM. Setup 6 AM. Admission $4. Talk-in 146.61 MHz. Info: LPARC, POB 30, LaPorte IN 46350.

April 29, 30, and May 1: Dayton, OH - Dayton HamVention. Hara Arena, Information, General: (513) 276-6930, Flea Market: (513) 276-6932 (Reservations not accepted by phone). Write: Hamvention, Box 964, Dayton, OH 45401-0964.

Advance Registration: Checks in $US, payable to Dayton Hamvention. Send name, address, call, and day and evening phone numbers. Enclose separate checks for admission and Flea Market.

Be sure to indicate either: Send admission tickets ONLY if flea market space assigned. Send admission tickets REGARDLESS of space assignment. Admission: $11.00 per person ($14.00 at door, good all 3 days). Banquet: $22.00 per person ($24.00 at door, if available). Send

to: Dayton Hamvention, Box 1446, Dayton, OH 45401-
1446.

JUNE

June 12, Sunday: Willow Springs, IL 6 Meter Club Ham-
fest, Six Meter Club of Chicago. Santa Fe Speedway,
91st Street and Wolf Road. Admission $5. Gates open
6AM. Talk-in on 146.52 simplex or 146.97 repeater.
Info, call Joe Gutwein, WA9RIJ, at (708)963-4922.

JULY

July 24, Sunday: Stickney, IL - DuPage ARC hamfest,
Hawthorne Race Course, 3500 South Cicero Ave. Handicap
accessible. Starts at 6 AM. Talk in on 142.25 MHz
with 107.2 PL. (-600). VE Testing 9 - 12. Advance
tickets are $4.00, $5.00 at the door.

This hamfest used to be held at the American Legion in
Downers Grove and was a good small to medium-sized ham-
fest. This year, there will be a 30,000 square foot
indoor exhibit area in an air conditioned building,
plus outdoor tailgating.

For advance tickets, send check payable to DARC,
enclose SASE, and send to Hamfest 94, 7511 Walnuut Ave,
Woodridge, IL 60517. For commercial or fleamarket
tables info, call 708-985-9256.

527. Antenna's -- One more Question

Newsgroup: rec.radio.scanner
Date: 1994-01-21 19:33:04 UTC
From: g5g192@rick.cs.ubc.ca
Message-ID: <2hpalg$ar@cs.ubc.ca>
Source record: 277674

Ok... I've gotten a lot of answers to all my questions. Before
I buy the antenna that I want, I have *one* more question to ask =).

Basically, I had asked for an antenna that would increase
cordless phone reception. I was told to get a fibreglass
whip from RS, and cut it down to ~ 72 inches for cordless
phones.

These are my questions. First of all, will this whip improve
other reception at all? For example, if I'm scanning police
freq's in my car, should I have the regular scanner antenna
plugged in (I have a Pro-43) or the whip?

Also, I noticed RS sells an antenna that's optimized for the
police bands, and some other bands. Would someone who's
familiar with this tell me how this would do on cordless phones?
It would be nice to get this because then I'd have a police
antenna as well...

Finally, in comparison between the antenna on the scanner, the
fibreglass whip, and the scanner "police" antenna, how much
will the scanner "police" antenna improve my reception of
cordless phones? How much more will the fibreglass whip do this?

thanx a lot!

ttul!

Omid Ramin

My $0.02: I got a Tropez and LOVED the features, sound, and
quality. The high end model has a GREAT speakerphone too! Alas, I
returned it because it got less than 1 day battery life from the
base. It's also REAL HEAVY (more than my cell phone). The manual
indicates that it is to be returned to the base when not in use or
needed. This would have worked fine in other setups I have had,
but I needed the 7+ days life I get from my AT&T.

In <djc.2a4o@terapin.com>, Don Coco writes:
May you become the first person on your
>block to Tell your Neighbors that you can listen to AM/Stereo.

But why would anyone want to?! Unless there's been some vast improvements
in the AM broadcast. Here there's only 2 local stations left on AM,
the rest are FM Stereo.
The quality and definition from an FM broadcast leaves the AM ones for
dead.

|> If you have an experienced opinion of the ICOM R7100 and/or the
|> AR 3000 please post or email me. Thanks.
|>
|> Rob Keefe <rkeefe@indyvax.iupui.edu>

I tried them both before buying the R7100.

Besides having more channels, the Icom has 'selected-group' scanning, which
allows one to associate any number of channels anywhere in memory (000-899)
with one of ten groups (0-9). You can change the group being scanned on-the-fly,
and scan two alternately by using window scanning.
I like groups as opposed to banks because the group can be as small as
needed, so that channels aren't wasted.
The AR3000 has SW and SSB capability, but nowhere as good as a dedicated
shortwave radio, because of the lack of narrow filters and small enough tuning
step for SSB. So I bought a shortwave rig to cover 100KHz to 30MHz.

Except some brands, right here in HK most HAM rigs are
indivually imported and sold at approx. 75% of the listed
prices according to the CQ HAM RADIO magazine, the famous
and oldest (official?) Japanese HAM magazine.
Normally, we can't get that prices from HAM shops in Japan
for just walk-in. However, there're great discount for
some selected items from time to time. Just look at the
ads. on CQ HAM RADIO before you go shopping!

Scanner FAQ's are available via e-mail at info@arrl.org. Here's how to do it:

Send e-mail to info@arrl.org
On the SUBJECT line put Request
In the message put send faqscan.txt
quit

That should have it e-mailed to you. If you run into problems, send another e-mail and instead of "send faqscan.txt", put "help" or "index".

: west-central Pennsylvania?
: - Dave

Well, I'm not sure about Penn. but most (if not all) traffic between 108 - 136
MHz is going to be reserved for Aircraft as you so mentioned. So you'll
be able to pickup the local airports and aircraft. Nothing special,
unless that's your forte'.

From: steve.jones@canrem.com
Message-ID: <60.3350.5773.0N192093@canrem.com>
Source record: 277599

Sorry for taking so long with this but here's the freqs worth monitoring
in Algonquin Park.

My OLD List

46.780 Park
46.880 Algonquin Region
46.700 Common Channel
46.740 Common Channel

My NEW List (taken from OMNR SPRING 1992 CHANNEL GUIDE)

46.880 Whitney (Ch. 11)
46.450 NorthWest (Ch. 21) (46.850 repeater output)
46.430 NorthEast (Ch. 23) (46.830 repeater output?)
46.330 South (Ch. 09)

Note: The New frequencies are handheld outputs! Channels 09, 21 and
23 are capable of autopatches which would indicate repeaters. Our local
MNR uses a repeater on Channel 21 which has an output on 46.850. Search
between 46 and 47 and you should be able to find them. The radio's are
standard across the province so NorthWest should be on 46.850.

Cheers,

> 145.55Mhz. What I am wondering is has anyone ever heard non-digital

There is only 1 Mir station. 145.55 is an amateur radio frequency. What
you are hearing is not "digital audio" but rather AX.25 ham packets.

> Who makes up these splits?

It may have something to do with bandwidth or with isolation of the
receiver from its own transmitter on the repeater. The "standard" split gets
larger as the frequency increases, so that the separation between receive freq
(input) and transmit freq (output) doesn't become too small a percentage of
the operating frequencies.

550. Here it is: The Jack Coles Earthquake prediction

Newsgroup: rec.radio.scanner
Date: 1994-01-22 19:49:34 UTC
From: srhoades@netcom.com
Message-ID: <srhoadesCK1r2M.BK1@netcom.com>
Source record: 277601

Daniel Moos (moos@pangea.Stanford.EDU) posted this to ca.earthquakes.
Since this is only a statewide newsgroup, I am reposting it here.

Newsgroups: ca.earthquakes
Subject: Text of Jack Cole's "prediction" of 1/15/94
Date: 21 Jan 1994 20:04:49 GMT
Organization: Stanford Univ. Earth Sciences
Lines: 44
Distribution: ca
Message-ID: <2hpch1$4m@morrow.stanford.edu>
NNTP-Posting-Host: pangea.stanford.edu

Many folks have expressed an interest in seeing the text of Jack C's
prediction of the Northridge quake - here it is (verbatim):

Date Time sent Pages Probability
01/15/94 3:24 PM 1 Emergency Release. 54.3% Chance

S.F.Bay Area and L.A. Area

Reports are coming in from all over the bay area and southern California of
increased radio signals, magnetic anomalies and many cases of electrical
problems. >
Continuing fore-shocks (3.5 to 5) for the bay area and Radio Quake-Signals are
coming in frequently now. Main signals come in at 25,16, 9, 4, and "1" day(s)
before event(s). Best results within three and a half and one day. Radio
earthquake signals remain constant from the Pacific ring of fire (West coast),
and results could mean a quake greater than Six points on the Richter scale.
Damage could be devastating. !
More updates to follow.

A Main Signal (possible One(1) to Four(4) day type) happen on Jan. 14, 1994 at
2:57P.M. This signal was medium to large and may reach a Four(4) to five(5) on
the scale during the next forty-eight(48) hours. If it is quiet for seventy-
two(72) hours the quake could be 4.5 to 6 on the scale around the ninety-six(96)
hour time frame. If it is quiet for eight(8) days the quake could reach a
five(5) to a seven(7) on the scale on or near the ninth day.
Another set of smaller signals happen on Jan 13, 1994 at 12:.m. These signals
were small and may reach a 3 or 4 on the scale during the next 96 hours. The
location of these signals was toward Southern California and may be felt in
Los Angeles.
A location was hard to determin due to lack of radio detection equipment in the
Hayward and L.A. Fault regions. These signals were much like the signal that
happened on Aug. 10 before the 5.0 that happen the next day. We are looking to
put up stations up and down the coast. Next week we should have Calistoga,

Pacifica, Cupertino, San Jose, and Santa Cruz linked together in a net to try
to triangulate and get a fix on the center of the many quakes.

"The longer the wait the greater the quake."
If you have any questions call Jack Coles and leave a message...(800)622-8902.

Read it and weep!
Dan Moos

Actually, the output range is 869.040 - 893.980 (That's going from
memory, but it is definately 869-894), & each input channel is exactly
45MHz lower than the output.

This is for the U.S. AMPS cellular system.

> I get away with no extra component?

I'm using 75-ohm cable for my PRO-2005 base and it works fine. All you should need is a converter from the cable F-connector to whatever connector is on your scanner. Even though there is an impedence mismatch, material I've read says that it isn't that big a deal since you're not going to maintain a constant impedence over such a wide frequency range anyways. Shielding of most 75-ohm cable is better than 50-ohm so what you lose in the mismatch may be made up by reduced signal loss. I also use an in-line amp to help out the 400 MHz + frequencies.

Happy scanning!

dquill@netcom.com (Daniel Quill) asked about speaker failure in the PRO-43 -

I've heard on CompuServe of a number of similar cases. A few months ago
it was reported that National Parts was backordered 10 months on the speaker.
If your PRO-43 is still in warranty you should take it back and demand repair
or replacement. If your mod didn't affect the audio, the repair center should
just ignore it (replacement may be a different story).
For reference, did you do an audio mod and, if so, which version ?

As I remember, two people on CompuServe have had their PRO-43's speakers
die. I guess it's the weak part of the hardware.

>Unfortunately, since it's moded, the warranty is gone.

Not necessarily. Unless you blew the speaker by doing the mod, many RS
stores will still honor the warranty.

In article <1994Jan13.192345.15695@alw.nih.gov> weisen@alw.nih.gov (Neil Weisenfeld) wrote:
>Does anyone have the frequencies handy for the Arlington VA police? I have
>some out of the 3rd Ed. Scanner Master guide, but whenever they switch to
>"channel 1-B(aker)", I lose them.

Arlington County uses a trunked system in the 800MHz range for ALL its public safety communications. Unless they decide to keep a specific incident on the same channel for the duration of the incident, one person keying the microphone will be on one frequency...but the next person will likely be on a DIFFERENT frequency. And there will also be a data channel using one of their frequencies....which often changes each day.

To try to follow a conversation, enter all the following freqs into your scanner memories, turn off a "delay" feature, and prepare to hear radio traffic on some of the freqs which is not related to what you're trying to follow. When you come across the data signal, lock that particular freq out so the radio won't stop on that channel. But you'll have to check that each day...and probably lock out THAT day's data channel.

With that said, here's Arlington's lineup:

856.4375 857.4375 858.4375 859.4375 860.4375
856.4875 857.4875 858.4875 859.4875 860.4875
856.7625 857.7625 858.7625 859.7625 860.7625
856.9375 857.9375 858.9375 859.9375 860.9375

Another netter posted some 453MHz freqs (their original, pre-trunked freqs). Arlington has decided to simulcast their dispatch on the 453MHz freqs for the benefit of their own police and fire/rescue personnel who have scanners, as well as news media folks. But the best listening -- as well as the hardest to follow -- will be on the trunked system.

Happy monitoring!

Standard disclaimer blah, blah, blah.

From: bart5@evans.ee.adfa.oz.au
Message-ID: <BART5.94Jan23155643@evans.ee.adfa.oz.au>
Source record: 277611

One disadvantage of the discone antenna is that it provides a lot of bird perching space, so you
will get droppings underneath and all over the lower elements. Because the discone is best mounted high, its also a good lookout for birds.

One advantage of the discone is that is gain is constant across a wide range of frequencies and this may be useful for measurement. However the equivalent cross section will decrease with the square of the frequency, so it will perform poorly at Ghz frequencies, much worse than a directional antenna.

Another advantage is its impressive looking appearance. Your friends may ask you what TV channel is that antenna for. A good scanner conversation starting artifact.

Jack Albert, WA9FVP, is WILLCO. He posts articles here and in
the rec.radio.scanner group occasionally, often about the ICM1024.

If you see one of his articles, send him e-mail and I'm sure he will
help you. Sorry, I don't have Jack's e-mail address handy.

NOTE: I'm the (satisfied) ex-R-71A owner who published the initial
warning in QST about Icom's battery backed up memory. I never owned
the WILLCO board, but Jack is a pretty bright guy.

Not true! I tested the new Denon AM stereo tuner in the Chicagoland
area and the quality of the AM stations were ALMOST identical to the
FM stereo (you had to really be good to hear the differance). This
tuner shows the potential of AM stereo with the proper bandwidth
and detection scheme (diode detectors contribute 3% of distortion!)...

567. Scanning Kentucky Emergency

Newsgroup: rec.radio.scanner
Date: 1994-01-23 16:24:35 UTC
From: vhealey@crl.com
Message-ID: <2hu8c3$1lp@crl2.crl.com>
Source record: 277619

I just got back from a three day trip to Kentucky to delievery
bottled water for distribution to residents during weather emergency.
I was the lead truck in what was to be a five truck convoy up i-65.
Two of us left thursday and went to Aniston Al to pick up 40 tons of
bottled water. The other three left fri after we got thru to Louisville Ky.
I went to RS and bought a pro 2006 to supplement my hand held Alinco
DJ580 before reporting for work. The 2006 was simple to hook up using a
commet 2 meter and 70 cm antenna mag mounted on top of tractor.
I was disappointed in sensitivity of 2006 until I read manual
about an attenuator switch on back of unit. Sure enough it was set minus
10 db! Coming back through Chattaonoga Tn that swithc came in handy while
monitoring 70 cm PS band as Intermod was bad on downtown i-24. A quick
flip of the switch and everything was clear again. As I type this it just
dawned on me as to why I could not recieve Charlie Brown Airport on this
radio with an inside antenna, as it was still flipped to the left, -10db.
We heard that there was a 50 mile backup on i-65 at the state line
as the authorites had ordered it shut down again Thu night at 10 PM due to
ice completely covering the highway for 80 some miles through the
mountains. This was confirmed by the clear channel radio station WWL about
2 AM Fri morning. We would be allowed into the state regardless because we
were to have a special pass but I personally reasoned that Pass or not we
would not be able to negotiate a 50 mile back up just to get into state
for the priviledge of driving on solid ice by ourselves. I also reasoned
that if I wanted to return the 2006 that radio shack would not take back
this $400 radio if it had been scratched in a truck plunging off the
interstate. So we got a motel in Franklin Tn. where my other driver got
stuck on 4 inchs of pack ice in the motels parking lot while trying to
back up. At that point cold and tired I vowed never to answer the phone
again on my days off!
When we got to the Ky line late Fri morning after 8 hours off
duty, we met the Ky National Guard. They were letting everyone through
although they said that it took them four hours in Humvees to convoy down
that morning. What kind of high tech communications where they using. A
look at two commanders with hand held radios showed they were using ....
tah dah.....CELLUAR PHONES! I wondered if RS would take back a 2006 that
had been modified to cover celluar, I couldn't remember what the celluar
mod even was to that particular model though I understand it isn't
supposed to be too difficult.
I discovered that they were using a mutal aid channel in the vhf
band that proved to be easy to monitor with both radios. This was 155.580
MHZ I think they called this channel 4. The scanner proved valuable in
letting me know accurately in advance what we would face. I will not bore
you with the hair rasing details of a trip through the mountains on ice
mixed with crazy people in four wheel drives and cars pulling U-haul

trailers! I almost hope they freeze to death in the various snow banks they plunged into. I was passed by a Greyhound Bus sliding from side to side on one hill and he was loaded with passengers! I bet the inside of that bus stank!!!
Lousiville was a sight. I saw one fellow driving slowly with parts falling off his battered car. Most of the others were impalled on snow ridges where they will eventually be retrieved, many had been hit repeatedly by others sliding on the same ice patchs. Out of 50 trucks avaiable to work the snow only 15 were driveable up there. I heard requests on the fire channel for fire trucks to go and drive down a certain street just to break up the ice so cars could pass! I live now in Ga. and even this far south they know enough to be prepared for that occasional snow or ice storm we may have!
My other driver and I got seperated after unloading and starting back. There was no way he could stop and I certainly wasn't going to speed up with an empty trailer to catch him. Just south of Lousiville at nightfall, a truck hit a mobile home and shut down the south bound side. I slid off at brook Ky to go to a motel for the night. So many trucks were trying to go to the truck stop that they had top get three police cars and the national guard brought in a big machine to scrap spome snow and pull out a long flatbed that got across the road. When I went to sleep across the street at the comfort inn I could still see all three patrol cars working traffic.
I awoke about 5:30 am and turned on the 2006 to 27.185 am mode. Nice little scanner picks up the cb 19 just like the aor 100xlt did. A few minutes latter I heard I heard truckers talking about a car and a four wheel drive passing them south bound. These two wrecked just as they got to our exit, one ramming the bank on the leftand sticking across the highway, the other on the exact opposit side. Trucks could pass down the middle if they were careful. Such language! I called 911 and reported the incident and a patrol car dropped by shortly afterwards to warn of the accident. A short while later another car hit the wreckage. Oh well. About an hour later I heard of a jacknife 3 miles south of my location so I called 911 again to send aid. This a nice warm bed with a view of the intersate is the only way to go during a snow emergency. My boss though it would be nice if I came on back to Atlanta though. I was happy to report I could not get out as I was blocked in by dozens of other vechiles. When I went to lobby to get the free breakfast I learned that 30 or 40 people who had shown up late at night as the roads froze again had spent the night sleeping in the hall ways and in the lounge. Nice of the Comfort Inns to do that! Against the rules but compassionate and reasonable given the conditions. So many attractive women and I had two king size double beds all to myself. I felt bad. Oh well. I talked briefly with one who was reading a book "Men are from Mars.", I wondered to myself what her problem was, she couldn't have know I had the extra bed and I sure didn't tell her!
I left about noon after setting up both radios again to monitor conditons. We would stop while authorities would recover vehicles that were wrecked and people would walk up to my truck to listen to the radio chatter. I guess the antennas caught their attention. I have got three

supplied by the company before I even add mine.
The most interesting communication I head was around 2:30 PM Sat EST. Apparently a VFD resuce person had an accident in which his vehcile plunged into a gorge coming to rest upside down in a creek. He was barley aduible to dispatchers. (I wonder why? sarcasim). Believe it or not when the chief ordered out an ambulance the dispatcher said she could not send one without a street address! I could not make out exactly what the chief said at that point but I think both she and I discerned HE WAS NOT A HAPPY CAMPER! The ambulance was promptly dispatched! Don't you just love our beaucracy and its rules! Just as I was complete out of range I heard that the firefighter had been extracated from the wreckage and I look forward to hearing of this account in the Reader's Digest or on tv's rescue 911. I wonder if they will include the detail about the ambulance dispatch?

Well I hope someone appreciates a few notes about the radio traffic and how this hobby can be useful in real life. It has been therapy for me to unwind by typing this. Please excuss the typing errors.

Victor Healey Ki4je Marietta Georgia
vhealey@crl.com

PS Thanks to all who answered my inquiry about the Yupiteru and AOR radios. Special THANKS to Marvin Moss of Marietta Georgia who sent 26 pages by snail mail. That was on my desk when I got home at 10 sat night. Way to go Marvin! Marvin I didn't know you were on the Internet, do you get in through Lockheed Corp account? Could you post your email address?

568. PRO34 Doc Needed

Newsgroup: rec.radio.scanner
Date: 1994-01-23 16:50:08 UTC
From: hl1@soc4.acpub.duke.edu
Message-ID: <2hu9s0$fjg@news.duke.edu>
Source record: 277620

I have a brother without access to the Net whose PRO34 seems to have lost sensitivity recently. (He has a terrible two running around the house)

Any suggestions on what to look for first? The unit is still operable but shows low sensitivity compared to memories of the past performance and direct comparison to a AR1000.

At the first Monitoring Times Convention in Knoxville there was someone mentioned who could align PRO34's. When Bob Grove was testing scanners for threshold, someone gave him a PRO34 that had a readable signal at 0.2 uv versis the more average 1.0 uv. Does anyone know who this tuner was and what his address is?

576. Cellphone maintainance mode info.

Newsgroup: rec.radio.scanner
Date: 1994-01-24 05:29:23 UTC
From: pgunn@alkali.otago.ac.nz
Message-ID: <pgunn.89.759389363@alkali.otago.ac.nz>
Source record: 277529

To all those who know about getting into the maintainance mode on cell phones.

My friend has a cellphone he is curious about. The brand is given as Telecom (our service provider in NZ) so that doesn't help, but he suspects that it is a Uniden model that has been reflagged. The model number is given as ST-1000 if that means anything.

It's a transportable (about the size of an XT keyboard I guess) rather than a belt sized one. Recent vintage (well ~18 months I guess).

He wishes to know how to get into the maintainance functions and what you can do there and how to do it.

Any suggestions or details on any models gratefully accepted.

For those who are worried about his reasons, he's an electronics technician who just wants to KNOW.

Thank you.

577. Pro-35 battery info please

Newsgroup: rec.radio.scanner
Date: 1994-01-24 05:34:21 UTC
From: chowes@nyx10.cs.du.edu
Message-ID: <1994Jan24.053421.26924@mnemosyne.cs.du.edu>
Source record: 277528

I just bought at a great price a Pro-35 scanner (RS stk# 20-136). It does not have a battery with it. The local manager tells me the radio has been discontinued and the battery is no longer available. I looked at theiri Amateur radio HTs and see the Pro-35 battery is deffinatly different than the ICOM BP8 style on the Amateur gear. The scanner works on a 12V cord from the lighter plug, but a bettery would be nice.

Can anyone suggest a source?

TNX, Chester Howes <chowes@nyx.cs.du.edu>

Hi, Folks.

It is with a heavy heart that I list the following items for sale.

Manuals and documentation are included with each item.
Prices listed below are with U.S. shipping included.
Make an offer on any item you think is overpriced.
For everyone's protection, ALL transactions will be C.O.D.

AEA PK-88 Terminal Node Controller, 110V pwr supply 110.00
firmware revision 23.AUG.91

Alinco DR-110 2m mobile FM xcvr 5W/45W, bracket, hardware 250.00
rcv/xmit 130-170 MHz modification made

Alinco DJ-160 2m HT xcvr 0.3/3 Watt (2 nicad packs & chgr) 250.00
rcv/xmit 130-174 MHz modification made

Astron RS-20A 12VDC - 16 Amp (20A peak) power supply 120.00

Bencher Iambic paddle set (nickel on black base) 60.00

Heathkit HW-101 HF xcvr, pwr supply 250.00
note that this includes shipping on the *heavy* pwr supply

HP-48SX calculator, serial interface cable 200.00
rom revision E

HP Equation Library card for HP-48 50.00

HP 82240B IR-printer, PC interface 90.00
This is the newer printer, not the original

HP-95LX palmtop computer, 512K PCMCIA card, PC interface kit 250.00
this is the 512K model (pre-1M), but with accessories

MFJ 945C 300W antenna tuner/meter/balun 90.00

MFJ 407B "Deluxe" Electronic morse keyer 55.00

Realistic PRO-2021 scanner 150.00
200 ch in 10 banks w/ search - This was a top-line scanner
in the days when UHF-T was the highest frequency of interest,
still good in areas where not much has gone above 512 MHz.

Realistic PRO-43 scanner (w/ cellular mod performed) 275.00
The handheld they're not allowed to make anymore.

Regency HR-2B 2m 12 ch. xtal mobile xcvr 2W/10W 60.00
Note! This is an older model, but with good power. But not
enough overload protection or selectivity for congested areas.
Xtals for a few popular freqs included. Good radio for
smaller cities or rural areas, though.

Sony ICF-2010 SW receiver 250.00

Cheerio!

I too bought an ar-1500E & I am a little dissapointed in its performance!

I find that to reslove an SSB signal its realy difficult (bfo knob too
small bfo to noisey) !!!!!. Air band also suffers, in that the first letter
of any word spoken is "lost" as the signal breaks the squelch ! I spoke with
AOR (UK) & the guy said that its a feature & unfortuanely there was nothing
that could be done about it ! It also sufferd from Band 2 breakthrough on air
-band, HF infact every where!!!! I cured it on air band with a filter from
AOR which goes in-line on the ant (not too bad now).

I agree with the article you posted HF should be billed as an "Also With"
feature. It can work but what a noise ! even when connected to a G5RV &
an ATU the coverage is, well, just a bit naff ! Band 2 bleed through & when
you do find a signal tuning the nightmare bfo is a pain !

I have a Lowe HF-150 for HF so I'm not so bothered now !

All in all I was a bit cheesed off with it !! to pay over 300 UK pounds for
something that the manufacturer claims if realy hot & to read in next months
Short Wave Magazine that it has been upgraded to EX spec & "Totally
Redesigned", well that realy hurt ! Made me mad !!!!

Anyone want to buy an AR-1500E ??? (Grin :-)))))

Stuart

Exactly. I tried a 12 Mhz crystal in a Pro-2004. While it did work most of the time, it did fail to stop on active channels quite often. Using a 10 Mhz crystal it works fine.

I've also put an 18 Mhz crystal into a Pro-2006. That one sure flies now!

Nick.

581. Re: Grove 800 number

A non-Internet capable ham has a few scanners for sale.

He buys at a whim and shelves them after a few hours of use.
Please write with offers and I will pass them on to him.

Icom R1 Bearcat BC-200XLT Realistic Pro-34 Realistic Pro-32
AOR AR-1000 Icom R-7000

The R7000 has the speech synthesis module. All (capable and
necessary) radios have been cell restored and are in otherwise
splendid condition.

I will post specs (after I get them from him) if we haven't seen
them enough times yet! :-)

As for me personally, I am looking for a dead or alive Pro 34
with a good screen (read as "that's all that counts"). I paid
$25 for a working unit with a smashed screen so please, no
offers over that. Thank you!

I want to buy a full converage handheld scanner in the next day or so. I would like to spend no more than $450 if possible.

I am tending towards the AR1000XLT, but have heard negative things posted on this group. Do people have positive things to say as well?

Also, while I can find ads for the ICOM and AOR scanners in magazines like Popular Communications, I never see anyone advertising YUPITERA (sp?) scanners? What's the deal here?

Thanks in advance!

If you have picked this up yet, can you please post info on Mass. State Police Freq.

There was some talk here about a month ago re: changing to 800MHZ. but
I oticed only some areas of S.P. frequencies getting less traffic. For example
Turnpike seems to be holding steady with traffic, but the other freqs. are
getting less trafic.

Also is there any info there on frequencies for the new traffic system
Smart Routes / Travellers??? I have a scanner in the car and listern to
them while driving and I noticed the usual copters in the air are getting less
traffic.

I have to go by and pick up a copy at U-Do-It, but have not had a chance yet.

so if you have the book, please post info on Mass S.P. for all of us to see.
and Smart Routes also if anything is listed.

586. Need Central/North Jersey/NYC frequencies...

>have any suggestions of specific frequencies I might find in
>west-central Pennsylvania?
>
>- Dave

The Aircraft are TREMENDOUSLY HELPFUL (and cool to listen to) if you know what to listen for. Here in central PA (Hbg) Harrisburg Departure is on 124.100MHz (aircraft have been heard on this channel as far away as Snow Shoe, PA on my BC-580 XLT). Whenever ANY aircraft in the area takes off, lands, or other activity, they must talk with Hbg Dep. Hbg Departure is responsible for handing aircraft off to their respective Centers, like Cleveland in Western PA, New York Center, in eastern PA, etc. What's the benefit? Whenever PSP aircraft take off, they notify Departure control, as do Rescue helicopters, Like Life Lion, MedSTAR, LifeFlight, etc. It's cool to listen to, but you have to learn how to interpret the info. Any questions about Central PA, write to YT7062@ark.ship.edu for more info...

I got it for $179. It looks like a really great phone but I have not used it yet because the batteries are charging. I bought it after hearing many good things on this news group. I would like to hear comments from other owners as to good/bad points about the phone and it's usable range. Also, if I want to put a person on hold and go to a corded phone, I know I can put them on hold and set the handset down, but can I return the handset to the base or does that release hold and hang up?

Anyway, if anyone wants additional opinions, E-mail me in a few weeks and I'll be able to give you an opinion then.

David

As the subject line says, I want a tunable receiver that will pick up Air Bands (108-137 Mhz). I don't need anything fancy, but I don't have much to go on. What would this entail, it can be rough but needs to be cheaper than buying a $100 scanner with the same capabilities (except lot's fancier). I had (as a kid) a radio shack kit that built an AM receiver, is that pretty close to what I have to do to pick up these higher freq's? I figure some of you guy's would know. If you know of a book that would tell me what I need, that would work fine. thanks in advance....

I do know of a Canadian source

Radio Lorenz
482 St. Catherine O.,
Montreal, Canada H3B 1A7
(514)392-9200

Ask for Helmut or Herbert Lorenz. (bob_m@holonet posted the adr. a while ago.) I bought my 7100 with them - and sent it in for fixing (it had a frequency error in the 144 MHz band - about 10kHz off) and received a replacement without any problem. The personnel are friendly and helpful.

I am not in any way connected with them - except for being a satisfied customer. I have heard good things about Javiation also.

Don't know about service/import after April. When I sent it for service, I sent a letter (5 copies) saying it was being sent in for warranty service only so no customs duty is charged on the way back after service. May be you could take a drive to Montreal (or whereever their service center is) if you need to get it serviced? (Great Briton is a long drive away and you have to have a boat).

Happy listening :)

Same here. Remember, though, that the pro-43 will requires that at least one channel in each bank NOT be locked out. ch100 is the last channel in bank 5. Did you lockout ch81-99?

Depending on your taste, here's a pretty simple solution. Get yourself one of those cheap made in the Far East FM broadcast radios. Now when you open these sets you will normally see one or two small coils of enamel coated wire, especially near the tuning capacitor. As you move your finger near one of these coils, you will find that the radio detunes. That coil is the mixer oscillator coil. What you need to do now is to gently pry the windings apart so that the spacing is greater now. Step two is to indentify the trimmers behind the big tuning capacitor. Usually such small radios are AM/FM. Behind the tuning capacitor you usually find 4 trimmers. 2 are related to AM and 1 is for the FM coarse tuning and another for the telescopic antenna matching. I leave it to you to experiment. The coarse tuning will have the effect of changing the tuning range, you should turn this so that both the plates are visible to you. The antenna trimmer is for you to adjust for best reception. What you can do is tune to any FM station, see which trimmer detunes it, that is probably the coarse tuning. Finally, look for a light blue IF transformer can. This is sometimes white but it is the discriminator transformer. Turn this slowly until the white noise (the hissing) becomes loudest. This is necessary so that the AM reception is clearer since most FM also has some AM ability. Now tune to some station in about 124 mHz (you go figure that out yourself). When the transmission comes on. Tune the antenna for best reception. There is ANOTHER coil on board which is normally close to a bunch of capacitor and one transistor. This is the RF amplifier section. You can also stretch the coil a little to get better gain at Air-band.

There you go. A cheap ($5 or so) but working Air-band monitor.
Of course you don't get digital display or memory scanning .... but what do you expect :)

Have fun. 73 de 9VG Daniel

Hi,
I recently acquired a pro-2026, not a bad scanner, but it has no internal backup for its memory. Not a big deal if you wire it in permanently, it has 3 power wires, 1 goes to the ignition switch, 1 goes directly to the battery and 1 for ground. I find this to be an anoyance as I move it between the car and house regularly, and sometimes have to rekey in the channels, sometimes it retains them. Other than that it is a pretty good 100 channel unit. Freq is from 29Mhz to 956Mhz (not continous), and it is cell restorable.

The cell restore is done by removing the bottom and snipping one rather largish jumper, about 3 minutes work.

On the whole I am happy with the unit.

Peter.

606. Frequency sort ???

To All Hams World-Wide,

I spotted a reference to a FREE logging program on a conference that I monitor on USENET. I had the article published in our Club newsletter as well as mailed to over 75 Hamclubs throughout Calif., Hawaii, the East Coast!

A friend of mine sent for this program. He received his program but it isn't free. I find this sort of advertising to be deceptive and misleading. I find that $49.99 is not exactly free or did I miss something when I read the following description to SPLog.

The following text was excerpted from the post on USENET and the docs that came with SPLog!

In article <888_9401201730@chigate.fidonet.org>, jerry.smith@radiohobby.chigate.com (Jerry Smith) writes:
|> Hi, Cali...
|> Do you mean 30 khz intervals? The typical channel spacing for cellular
|> phone channels is 30 khz. So, you aren't missing anything.
|>
|> Jerry...Chicago

Then I'm confused. My BC200xlt scans like this:

870.600
870.612
870.625
870.637
870.650
870.662
870.675
870.687
870.700

That looks to me to be 12.5khz spacing. What's wrong?

To All Hams World-Wide,

I spotted a reference to a FREE logging program on a conference that I monitor on USENET. I had the article published in our Club newsletter as well as mailed to over 75 Hamclubs throughout Calif., Hawaii, the East Coast!

A friend of mine sent for this program. He received his program but it isn't free. I find this sort of advertising to be deceptive and misleading. I find that $49.99 is not exactly free or did I miss something when I read the following description to SPLog.

The following text was excerpted from the post on USENET and the docs that came with SPLog!
---

* * * FREE LOGBOOK SOFTWARE * * *
^^^^^^^^^^^^^^^^^^^^^
Greetings to all.

Latest version of very popular Logging software SPLog is now available to the world at large.

For your free copy, send a formatted disk of your choice
^^^^^^^^^
(IBM format) with SASE (Foreign stamps are No Good in Canada) to:

Peter Pfeiffer
63 Beaver Cr.
Brantford, Ont.
N3P 1T3
Canada

Please do not send thin envelopes. Try to send a disc mailer and I will re-use it to return your disc.
This is a free offer so try not to put me to any expense.
^^^^^^^^^^

The following is an excerpt from SPLog's documentaion files
^^^
8.0 SPLog License

SPLog is NOT a Public Domain program and is NOT free. SPLog is copyright (C) 1990-1994 by Alpha Business Software.

Regular Registration Price $49.99
^^^^^
Version Introducion (Until May 1, 94) $39.99

^^^^^
Registered Users: Upgrade Diskette $15.00
^^^^^
Non-registered users of this program are granted a limited one
month license to SPLog to evaluate the programs suitability for their
requirements. Any usage of SPLog beyond evaluation time period
requires registration of each copy of the program used. Use of non-
registered copies of SPLog beyond the original evaluation period is
prohibited.

I plan to send a copy of this post to Peter, VE3NPL@VE3EUK.#SCON.ON.CAN.NA,

615. Re: NJ State Police Frequencies

Newsgroup: rec.radio.scanner
Date: 1994-01-25 17:14:14 UTC
From: jung@base.bellcore.com
Message-ID: <1994Jan25.171414.25246@porthos.cc.bellcore.com>
Source record: 277561

Some basic NJ freqs:

154.680 SPEN 1
155.475 SPEN 2
154.725 SPEN 3
153.785 SPEN 4 / JEMS 4
155.295 NorStar (Medevac) dispatch

SPEN = statewide police emergency network.
JEMS 4 is used for coordination on large multi-casualty incidents
After dispatch, NorStar switches over to the trunked state police
network, and will contact the fire/ems agency on their frequency.

I don't have too much else from "up north". I have mostly Morris,
Somerset and Middlesex counties if you're interested.

cbarkley@cbnewst.cb.att.com (shawn.p.hughes) sez:
>
> I just got a scanner, and I need frequencies to scan.
> Also, any advice would be appreciated.

My advice is: get thee to Radio Shack and buy the NJ _Police Call_
for starters. Enter your local police, fire, and gummint freqs.
Take it from there.

In light of the atrocious weather, I highly recommend 453.000 MHz --
that's where the Shadow Traffic choppers and vans relay their
on-the-spot traffic info in North NJ. It beats the hell out of the
everywhere-but-where-you-care-about coverage that you get on the radio.
And you usually get it before it's too late to avoid the traffic.

On a related note, I'd like to swap other NYC-north NJ media frequencies
-- ABC, CBS, etc -- with interested parties.

The phone is great, customer service is below par.

I'm on my third 900DX phone. The first generated lots of harmonics into the 440 ham band,

The replacement for the first, had a short in the handset and it wreaked with a perfume smell, plus I waited a month. I think it was a refurb unit

The replacement for the replacement has harmonics (448 Mhz) but not to bad. It's a new unit because I demanded one from Vtech

Overall, I'm happy with the phone! If you have a problem, make sure you get a new unit and not a refurb.

Weird, I saw an article, I think in monitoring times, although I can't
be sure. But anyway the article stated that someone was giving a speech
on the security of cellular phones or something,, (being real specific here)
but anyway, the point is that this guy punched a couple of buttons on a
hand held phone and it suddenly became a cellular phone scanner!

The article you might be citing was in the Jan '94 Monitoring Times in the
'Scanning Report' section (p34). The article stated: "The director of Sun
Microsystems, John Gage, told the House Energy and Commerce subcommittee
that "every cellular phone is a scanner".'

1) Is there any truth to this,
2) How realistic is it to preform this?
3) Any comments / Info about this new Free cellular phone scanner
possibility??

The article goes on by saying some of the things that Gage failed to tell
the subcommittee - keys have to be pressed in a specific order, the procedure
varies between manfacturers and some disassembly may be required. Check out
the articles in Nuts and Volts. They have been covering cell phone
reprogramming lately. On the surface it seems as if there are elements of
truth in the MT article. [Just for the record: is Gage a noted authority on
cellular phones?]

|> someone was giving a speech on the security of cellular phones

Many moons ago, we saw a posting by a man who performed that procedure in front of some Congressional committee in Washington, D.C. He explained (in soft focus) what he did and stated that he will not give out the details of the procedure to those who asked. It was, I believe, to argue against the son of the ECPA by showing that cellular phones were indeed the types of devices the son of the ECPA forbids the manufacture of, or that it is very easy in general to monitor such conversations.

Over time, we have seen many postings by people who explain the procedure for specific models, but I don't think the issue was ever settled as to whether the cellular carrier knows the unit is "off the hook" and, thus, charges for air time while you are listening to conversations.

I guess if you never register the phone, you might be able to get something going, but dealers often put in fine print under the $47 cell phone "add $300 to price without phone activation".

626. TV channel spacing

Newsgroup: rec.radio.scanner
Date: 1994-01-25 22:47:09 UTC
From: johnlt@hub.parallan.com
Message-ID: <a6cqgc10w165w@hub.parallan.com>
Source record: 277477

Why is it that TV channels are usually not just assigned sequentially ie. 2,3,4,5,6,7 but instead in most areas the TV channels skip around some so that they are pretty evenly spaced out. Is it so that the sequential channels don't interfere with each other? Also it seems like certain channels are more popular - 2,4,5,7,9,11,13. When the a scanner stops on something that sounds like noise is it ever getting the video signal from a TV channel and converting it to audio? What frequencies would the video signal from tv be sent on, would it be right next to the audio signal?

Date: 1994-01-26 00:53:07 UTC
From: vhealey@crl.com
Message-ID: <2i4etj$sbs@crl2.crl.com>
Source record: 277475

Is the Pro 43 any good? Yeah i know it is radio shacks top hand held but I see many apparently do not like dieplay battery life and unreliable speaker .

I picked up a Pro 46 and for $180 it gives a bigger bang for the buck then I thought it would.

It doesn't compare with the AOR1000xl but then apparently the Yupiteu is the only hand held that is better then that.

Comments... I take the 46 back in a heartbeat if you can tell me why the 43 is worth $120 more cash outlay.

By the way the display looks larger in the 46 then the 43.

Victor

PS I do know what triple conversion is but is it worth $120?

632. MA State Police 800 MHz system

Newsgroup: rec.radio.scanner
Date: 1994-01-26 01:49:27 UTC
From: steve@betabbs.trystero.com
Message-ID: <9401260124.AA01676@betabbs.trystero.com>
Source record: 277478

I would like to know if there is a way to get rid of celular interfearance
when listening to non-cellular frequencies. I'd like to listen to the
State Police 800 MHz stuff, but the cellular images get picked up by my
BC890XLT so much that it's too anoying to listen to. You constanly have
to keep hitting scan because the squlch is broken by a cellular image
all the time. If I used a specific 800 MHz antenna would this clear up?
If there were PL tones on the MA State police 800 MHz system I could
get the CTCSS board for the 890XLT, but thewre doesn't seem to be. Also
I have a 2m/70cm antenna on my car, and a glass mount 25-1000MHz
cellular look-a-like (but longer). Is there anything wrong with unscrewing
the all band antenna and putting a real cellular antenna on it?
And lastly, how can I use both antennas together for 2m/70cm/800MHz
all at once. Is it as easy as taking a BNC splitter and screwing both
of them in? Or will this cause undesired reception from the antenna that
isn't currently being used? (If I'm listening to a repeater on 2m, is the
presence of the cell antenna going to cause some random frequency to
come in also? If anyone has any answers for me please send me e-mail
as I don't have usenet access. :((email betabbs.trystero.com if possible
but trystero.com is fine too)
Thank you very much to all with help and all that took the time to read
in hopes of helping.

The only two things that come to mind (short of getting a better scanner) are 1. Try an attenuator. You should be able to attenuate the images while still leaving enough signal to receive the desired station. 2. In addition to the attenuator a directional antenna might help. If you can piont it toward the 800MHZ system without pointing it at any cell sites, you may attenuate the cell signals (less capture) and it would also give better performance with an attenuator. The more narrow the beamwidth the better. This assumes that the 800MHz system has a single repeater station (which it might).

635. Re: Pro-43, Problem locking out CH 100

Newsgroup: rec.radio.scanner
Date: 1994-01-26 02:58:15 UTC
From: mulligan@ACM.ORG
Message-ID: <2i4m87$3np@hopper.acm.org>
Source record: 277490

Ordinarily, the Pro-43 will not let you lockout all the channels in a bank, or de-select all banks. This was probably the problem reported by clinehe@cherokee3.rtsg.mot.com.
However, it is possible to lockout the last channel in a bank. If that is the only bank enabled for scanning, the PRO-43 has a cardiac arrest ....

****** W A R N I N G ******

To all PRO-43 owners

The PRO-43 will let you lockout all the channels in a bank. If that bank is the only one selected and you switch to scan mode (or turn it off), you've lost it. The only recourse is to reset the scanner and start re-programming all 200 channels. (Oh well, I wanted to reassign some of them anyway)

The key to this disaster is the Program mode. In Manual or Scan it will not let you lock out the last channel in a bank, but it will allow it if you're programming channels.

Ergo - When programming:
Leave another bank enabled for scan; or
Make sure at least one channel is left unlocked; or
Don't touch that !#$$%@ lockout key.

The FCC lists the mobile licensees using an SMR (Specialized Mobile Radio) trunk as 806.000 MHz. You can listen to them on one of the trunks operating in the 851-866 band, but there's no indication as to which trunk they're using.

Question:

The other day, I was perusing back issues of 73, and I stumbled across an article on how to connect an old Commodore 8-bit machine to receive RTTY.

My thought on the matter was that it would be neat to pick up the newsfeeds if they're out there. As I tune across my dial, I hear many RTTY signals, and I was wondering two things:

1. Are the newsfeeds (AP, UPI, etc) out there and available in this form?

2. Is an old Hallicrafters (an s-38b) sufficient to the task, and if so, what sort of hardware should be connected between its headphone socket and the input on my machine, and should the BFO be on or off and what useful info is there on how to tune it?

Thanks for any help you could supply.

I picked one up when they were on sale a while ago for $139US. Only gripe I have is that it locks up on certain frequencies when my um high-frequency detection device (ok radar detector) is also on. The 800 MHz mod is very easy (just clip a wire) and the search by service (police, fire, weather, marine, air) is great if you are in a new area.

639. Anyone ever tried the Xandi 800mhz to 400mhz mod kit???

Newsgroup: rec.radio.scanner

I can get a kit from xandi electronics for 50 bucks that will let me receive
800-950mhz on my 400-550 mhz scanner.
Has anyone ever used this kit,if so with what results?
Please leave mail with any and all info.
Thanks.

Source record: 277484

In some obscure part of the manual that comes with the Pro-43, it says something like: at least one channel in each bank must be scannable. IE if you tried to lock channelss 1-20 (in bank 1), channel 20 would be unlockable. This applies to all the other banks as well.

I tried a 20 Mhz xtal in my 2006 and it locked up. I then spoke to Cheek who recommended not to exceed 16 Mhz. 16 Mhz was the fastest speed at which no problems had been reported. I took the safe route and at 16 Mhz, have had no problems.

You can get a PRO-43 delivered for that price any day by mailorder from Marymac (800-231-3680) or U.S. Radio (800-433-7283). If RS does put it on sale, the Texas mailorder folks will lower their price even more. Last time the PRO-43 was on sale, US Radio sold them for $269 delivered. Grove also sells them.

The listings in FCC records for "806.000" (and for "896.000") are "placeholders", put on licenses issued to end users of trunking SMR business systems. 806.000 only tells you that the license is somewhere between 851 and 868.9875. 896.0 is used for those SMR type licensees above the cellular range.

These licenses are no longer issued, I believe, so there will now be NO indication in FCC records of any license for SMR end users, only the system licensee himself will show up no. The System Licensee is now solely responsible for who uses the system, having to report only number of total users to the FCC, not names.

I recently purchased a Radio Shack Realistic Pro-2010 from a garage sale.
It works great, save no manual.

It's been a long time since I've owned a scanner, and a few buttons
I can't get to work. I have a monitor button, a limit button, and
an up and down arrow button.

Does anyone know what these do? Is it possible to program a lo and
high frequency(cies) and have it do a scan between them?

Any information at all is greatly appreciated.

Here are some specs that someone recently posted:

Manufacturer - Yupiteru Industries Co Ltd.
12-33 Shibaura, 4-Chome,
Minato-Ku, Tokyo 108, Japan

Freq. Coverage - 530KHz - 1650MHZ

Receiving Modes - Wide FM, Narrow FM, AM,
Lower Sideband, Upper Side Band

Tuning Steps - Wide FM: 50KHz & 100KHz
Narrow FM: 1KHz, 5KHz, 6.25KHz, 9KHz, 10KHz
12.5KHz, 20KHz, 25KHz, 50KHz, 100KHz

Sensitivity - 0.53MHz-2MHz AM 10uV (S/N 10dB)
2.0MHz-30MHz AM 10uV (S/N 10dB)
USB/LSB 10uV (S/N 10dB)
FM 1.5uV (SINAD 12dB)
30MHz-1000MHz AM 0.5uV (S/N 10dB)
USB/LSB 0.5uV (S/N 10dB)
FM 0.5uV (SINAD 12dB)
1000MHz-1300MHz FM 1.0uV (SINAD 12dB)

Memory Channels - 1000 (In 10 banks of 100)

Search Banks - 10

Priority Chnls. - 1

Scan Speed - 30 Channels per second (approx)

Search Speed - 30 Increments per second (approx)

Power Req. - 4.8V Internal (4 x AA nicads)
12V DC External (200mA)

Audio Output - 100mW (8 ohm)

Current consumption - 140mA
100mA Standby

10mA Save

Dimensions - 64.4(w) x 155(h) x 38.2(d) mm

Weight - 320g

I ordered mine from:

Javiation Owner - Jonathan Clough
Carlton Works, Carlton Street
BRADFORD
West Yorkshire, BD7 1DA
United Kingdom

Phone 0274 732146 (From U.S. 011 44 274 732146)
Fax 0274 722627 (From U.S. 011 44 274 722627)

CompuServe address: 100117,535.
(Internet: 100117.535@CompuServe.COM or
clough@javiaton.demon.co.uk)

They I ordered mine about 1.5 weeks ago and they were backordered 2 weeks (they were very apologetic too about it too). Cost was $600 US, which included import duty and shipping via FedEx, which they said would take 2 days.

Someone also just recently posted this dealer info as well:

Radio Lorenz
482 St. Catherine O.,
Montreal, Canada H3B 1A7
(514)392-9200

You image problems cannot be fixed, at least easily. I have the same problem with a PRO-37. There is nothing you can do about it, it is problem with the radio's design.

As far as CTCSS, this would work if the MA State was using it, but they are not using it on the troop channels. The metro 28 channel trunk system, which includes the old metro troop and some of troop A (A, A5) use no tone on their frequencies. It is trunked and is not required for their use. Some of the conventional 800 state channels use tones:

A1 - Andover, A7 - Pebody 858.2375, use a Digital 051 (DPL) tone
C - Holden, C7 - Clinton 853.8375, use a CTCSS tone of 146.2
Statewide 866.0125, use a CTCSS tone of 156.7

There are more to add to the above, but I cannot think of them at this point in time.

charges for air time while you are listening to conversations.

>I guess if you never register the phone, you might be able to get something
>going, but dealers often put in fine print under the $47 cell phone "add
>$300 to price without phone activation".

An interesting twist to this is a situation that happened to me last
month. We purchased a cellular phone from NYNEX. When I tried it out,
I got a message saying that the phone number of my phone was not yet
activated. The person who programmed the phone number into the phone
apparently mixed up the number, so it was different than what was
registered. Upon calling the NYNEX dealer, I was given a procedure for
changing the phone number to the right one! Therefore, if I follow the
information above, I could potentially convert the phone to a scanner
and then change the phone number so the phone company can't tell it's
my phone that's off the hook (if they can do such a thing).

For those of you interested in how to modify the phone number, please
do not contact me. Once I made the change, I threw out the directions
and couldn't possibly remember them (except for punching in lots of 0's
(zeros)). You could call your local NYNEX dealer... Also, I would
guess that each phone has a different procedure.

If you like the As It Happens program on the CBC you'll want to
listen to Spectrum this Saturday, This week our guest for the live
segment will be Michael Enright of As It Happens. If you have any
questions about one of the most popular programs on international
radio this is your opportunity to have them answered. News and
info nuts, this is your night.

Spectrum airs on WWCR at 0300 UTC Sunday on a frequency of 5.810 MHz.
If you have access to a tvro satellite system you can hear the show
on the Omega Radio Network. Omega is found on Galaxy III
transponder 17 5.8 MHz Wide Band Audio.

```
|1. Are the newsfeeds (AP, UPI, etc) out there and available in this form?

Occasionally, some military Frequency Division Multiplex (FDM) pop up
on HF where one of the channels (85 hz shift) carries a news feed.
Every once in a while 6.993 Mhz has one of these FDM signals.

|2. Is an old Hallicrafters (an s-38b) sufficient to the task, and if so, what
| sort of hardware should be connected between its headphone socket and the
| input on my machine, and should the BFO be on or off and what useful info
| is there on how to tune it?

Forget it; the S-38b is a string-and-pulley affair tuned receiver. This
means that you won't have the stability to receive an RTTY signal for
long. You will quickly drift off the RTTY demodulator's filter bandwidth
(unless of course you are just using a PLL without audio filtering to
get the mark and space.)
```

I just got my scanner so I am new at all this. Someone mention touch tones and decoders a few posts ago. I was wonndering if anyone could explain why touch tones and decoders are used? Why would you want to get the information contained in the tones?

I am also curious about scrambling, someone also mentioned there are ways to unscramble freq's. How do they scramble the signals? How do you unscarmble the signals?

I'm sure there are other new people in this group who like to know more about this. Sorry if this is in the FAQ, last time I checked it wasn't.

663. Pro 43 Technical Info/Question

Newsgroup: rec.radio.scanner
Date: 1994-01-26 16:53:59 UTC
From: chris@tali.hsc.colorado.edu
Message-ID: <2i6777INN5ji@tali.hsc.colorado.edu>
Source record: 277517

I was wondering if anyone was getting some sever intermod in the MED
1-10 base channels, and if you are, is your 43 modified or stock.
I seem to be getting some really nasty inter-mod (mostly pagers) in
the standard MED channel (462-463 Mhz area) and was wondering if this was
related to the modifications as normally recognized.
Would the metal shield that protects the bottom board affect this type
of interference. I put it back, but I am wondering if I might have left a
millimeter or 2 of space that would not be there on a stock model.

...
>PS I do know what triple conversion is but is it worth $120?

I'm shopping for a scanner too, and was looking at the Pro 43
and 46 - but I just found out about the BC 200XLT deal.

Pro 46 Pro 43 BC 200 XLT
100 channels 200 channels 200 channels
1 priority ? priority 10 priority
800 MHz 800 MHz 800 MHz

$170 $350 ($299) $160

All of 'em have limit search, up and down, and are modifiable
for cellular. Any one know of any reason to prefer the
Pro series at all over the BC 200 XLT (discounting triple
conversion)?

Talk about wierd.. I recall someone asked a couple days ago for freqs to listen to while Prince Charles was in Australia. Most of the time, I just skip over those articles.. I don't have anything interesting to give them, and you so rarely hear about anything happening during such visits.

This afternoon, Headline News is reporting that a "gunman" in the crowd rushed the stage firing what turned out to be a starter's pistol at the Prince.

Were any of our readers around to pick up the action?

as New Jersey shuts down from this, the latest snow..

Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

In <1994Jan24.133529.29923@tellab5.tellabs.com> jwa@tellabs.com (John W. Albert)

|I purchased an Icom 745 about two weeks ago.
|After connecting it to my Kenwood PS-50 power
|supply (they are compatable), I noticed, that
|the VFO dial only tuned the radio about 100 Hz
|per 5 revolutions when the TS button was in.

|My Icom R71 moved about 10 kHz per revolution.
|I came to the conclusion that there was something
|wrong with the rotary sensor unit.

|Icom radios use a rotary sensor to detect the rotation
|of the tuning knob. The sensor is a phonolic board that
|has switch contacts plated on the surface. It also has
|a rotor with a metal wiper.

|The wiper is made up of very fine wires that are smaller than
|human hairs. The rotor moves along three plated switch tracks
|on a phonolic board. One track is a common ring that connects
|to the center solder tab on the board. The inner and outer
|tracks have alternating squares and connect to the outer pins.
|When the wiper moves along the tracks it makes and brakes
|the connection between the inner and outer rings. The middle
|ring connects to the + 5 volt supply.

|I called Icom and the replacement cost $50.00!! I decided it
|would be cheaper to repair the part. Also, in order to change
|it, the front panel will have to be removed.

|I tried contact cleaner and WD-40 but it didn't work. The part
|is simply worn out. After connecting a scope to the outer contacts
|I noticed that there was a considerable amount of contact bounce.

|The outer pins of the rotary dial is connected to the micro-
|processor and the inner pin connects to +5 volts. The contact
|bounce is probably confusing the uP. I connected a .001
|capacitor to each outer lead and the other end of each capacitor
|to the inner lead. The bounce was cleaned up and tuning knob
|works fine!

|I saved my self $50.00 and the aggravation of removing the
|radio's front panel. I'm shure, sooner or later, it will
|ware out completely but I did buy some time.

Wow, I thought the digital shaft encoders used some sort of optical LED/ shadow wheel combination. This leads to all sorts of interesting questions:

A) Do all ICOMs use this sort of technology? Will the R70 and R7000/R7100 sets all eventually fail due to the shaft encoder _WEARING_OUT_?

B) Does the JRC NRD-515/525/535 use exactly the same non-optical technology in their shaft encoders?

C) Since people tend to keep their superduper SW/VHF/UHF receivers for a long time, are replacement shaft encoders utilising this low-tech encoding a common item come replacement time? Do they come in relatively standard sizes?

D) Do optical technology shaft encoders have an output that would be directly compatible with this direct low-tech encoder?

E) What receivers _DO_ use an optical shaft encoder?

669. Realistic PRO-2004 Cellular Conversion Instructions

Newsgroup: rec.radio.scanner
Date: 1994-01-26 21:33:44 UTC
From: rats@cbnewsc.cb.att.com
Message-ID: <CK9AKB.7n4@cbnewsc.cb.att.com>
Source record: 277516
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Restoring Cellular Coverage on your PRO-2004

CAVEAT: While it is legal to own any scanner which covers the cellular band, it is no longer legal to eavesdrop on any type of mobile telephone conversation.

Early production models of the Realistic PRO-2004 had a diode added beneath circuit board PC-3 to disable cellular telephone coverage; it was the only component on the bottom of the board and easy to locate. Present production runs now place the diode on top of the board.

THE FIX

Remove the four rear apron screws and withdraw the radio from its cabinet; turn the radio over with the keyboard facing you.

Locate the shielded compartment on PC-3; gently press in the sides of the compartment and pry off the cover.

Note the straight row of components on the left side of the compartment; the last diode, D513, must be disconnected to restore cellular frequency coverage.

With a pair of wire cutters, carefully cut either lead of D513, then pull the diode slightly away. While the diode may be removed completely, leaving it partially in place will enable you to resoldier it at some future date if desirable (such as in case of warrenty repair.)

IMPROVING THE SQUELCH

The "rubbery" action of the squelch control -- hysteresis -- may be tightened up considerably by a simple procedure while the radio is still out of the cabinet.

Remove the lid from the shielded compartment on the larger circuit board and locate resistor R148 (47,000 ohms -- yellow, violet, orange) between pins 12 and 14 of IC2 (marked TK10420 3357).

Replace this resistor with a 220,000 ohm unit -- or even omit it entirely[*] -- for improved squelch performance.

NOTE: GROVE ENTERPRISES ASSUMES NO RESPONSIBILITY FOR DAMAGES CAUSED OR WARRENTIES VOIDED BY THE PROCEDURES DESCRIBED ABOVE.

---

[*] -- I don't recommend that the resistor be removed entirely because the squelch then intermittantly cuts out signals with rapidly varying signal strength i.e. mobile units traveling around buildings which block the RF signal to varying degrees. You can soldier another resistor in series with the 47K resistor to achieve the 220K or whatever new resistance value required. You could even soldier a small pot or rheostat in place to experiment.

> problem?

I just tried it on mine and it worked. Programmable scanners won't allow
you to lock out all of the channels. The last one left stays unlocked. Some
even refuse to allow lockout of all channels in a block.

Hello all,
I like the idea of a faster scan rate but is there another problem?
Isn't there a phase lock loop (PLL) inside that needs a certain amount of time
to settle out at the desired frequency? If one speeds up the the
processor, enabling it to execute its internal instructions faster,
thats great.

I am under the impression that the PLL looks to its own (analog) filter
for this settling time constant. If the processor "is asking" the PLL for
new frequencies faster that the PLL can settle (and thus produce them)
the scanner just sits there and scans (never stopping, or in a better
case, it will stop if the two programmed frequencies are very close and
the PLL does not have to make much of a transition).

Is this correct or is the frequency synthesisor different from the
bare bones description above?

From: kronz@periphae.ecn.purdue.edu
Message-ID: <CK9ozI.2oJ@noose.ecn.purdue.edu>
Source record: 277425

Ill try to answer this one...

Im Not 100 percent sure this is totally correct but should be in the ball park

The reason channels are spaced apart is not so much that they
will co-channel interfer but rather that they don't interfer with
with the same channel in a nearby state (area).

Remember on good nights T.v. signals can really go the distance.

About whether or not you are recieving video. Well the answer is yes/no

it depends on how you look at it yes that is the video signal /no
you cannot hook up the audio out of your scanner to the video in
of a monitor and expect to see the video..

The bandwidth of a T.V. channel is 6Mhz by the way if your interested
in how that 6Mhz is organized I can post something a little more
in depth...

hope this made some sort of sense...

c> possibility??

1. Yes, it is true. I believe it was an address to a subcommittee of
Congress, but can't be sure. It was in MT.

2. You can do it, but it would require knowing the password of the
phone. By typing in the correct numbers in sequence, you can 'unlock' the
phone to scan any frequency that is desirable.

3. Unless you can get a service manual of the phone, (highly unlikely
now that some of the manufacters know that we know) you won't be able to
unlock the phone. There was (or still is) a book that was talked about on
CompuServe that had the key to several manufacters of cell phones. Maybe
someone can shed some light on the title as I don't seem to recall the
name.

v> speaker .

v> PS I do know what triple conversion is but is it worth $120?

Hi, Victor...
I have seen only a couple of complaints about the speaker problem. I
don't think it is widespread, though.

Battery life is about average with every other scanner. The good thing
about this one is that you can have ni-cads or standard AA batteries,
something that Uniden doesn't offer. (Stuck w/ battery packs)

I believe the $120 is worth it. If you hate getting cellular images in
the middle of your sheriff or police frequency, then the '43 is the one to
get.

1. I have just purchased a PRO43 scanner, and would appreciate any advice with regards to the scanner (operating procedures not published in the manual, etc.) and any good frequencies for the following cities I travel to/from:

a. Dayton OH (Beavercreek OH, Wright-Patterson AFB, OH)
b. Erie, PA
c. South Bend, IN (Notre Dame, IN)

Note: I purchased a Radio Shack Police Call Guide, but it seems to contain only "canned" frequencies which may not be as important (or up to date) as other known frequencies in these cities.

2. I am thinking about subscribing to Grove's Monitoring Times. Any comments?

3. I am aware of the PRO43 800MHZ mod. As far as anyone knows, does this mod work for all PRO43s manufactured thus far? Also, for those
who are familiar with this mod, if someone were to ask, "What was the most difficult step in completing the mod", what would you say? (I'm looking for "lessons-learned").

4. Has anyone been able to figure out how to restore 108-118MHz for the pilots? I don't believe anyone has been able to restore these frequencies. Why they designed their top of the line hand-held not to receive frequencies that are available on their low-end units, I really don't know.

5. Please send email if you can help on any of the above items.

Thanks-you.

Robert Gray

I've been lurking this group for about a week and am really interested in the PRO-43 going on sale at RS outlets and mail-order sources this week. I got the faqscan.txt and mod files, but still have unanswered questions.

Where can I get a description of what frequencies are used by what services?

I take it from rgray's previous post that the 43 is missing 108-117 (which is aircraft) which is covered by lower cost units. Why? Restorable?

I also see that by moving the "restoration" diode vs removing it, I can pick up 55-88 MHz. What's of interest in that range?

Does the "restoration" add back both 824-850 AND 869-895MHz? Are both ranges cellular?

Any mods to pick up the 25-29MHz or so range for CB transmissions?

Any other suggestions?

Oh yes they can. The ESN, an electronic serial number, is programmed
into PROM at mfg. These can be changed on some cell phones by
connecting them to a PC based cell phone programmer. On some others the
PROM must be physically changed. The models that can be reprogrammed
are the hot ticket among the drug dealer crowd since they can use dthe
phone for a month or two without being traced. Then they simply
reprogram it.

BTW, the reprogrammers are available for as little as $250. See Nuts
and Volts magazine for adds.

>an up and down arrow button.
>
>Does anyone know what these do? Is it possible to program a lo and
>high frequency(cies) and have it do a scan between them?

To program HI and LO frequencies and search between them, do
program
limit
{enter LO freq}
limit
{enter HI freq}
enter (i think)
press up or down arrow(direction of search)

I hope I have not missed anything. If this does not work (or
if you don't have the PROGRAM key or ENTER key), try some variations
of the above procedure. [I don't have a Pro2010] :)

Monitor button is when you want to capture the frequency (in SEARCH)
into the monitor memory (that can be later transferred into a
memory channel). When you hear something interesting when
searching, press MONITOR and it stores it in the next (of 10?)
monitor channel (and comes out of the search mode).

Well, you could buy a phone with activation, canceling it after the first
month. Or how about buying a used phone from someone. Usually they will
have it de-activated since they don't want to get charged for the new
owners calls.

I recently upgraded from a Bearcat 70XLT to an AR900 handheld. I'm a little disappointed with the AR900, but since I bought it used I don't know if it's broke or just the radio's characteristics.

The scanning isn't smooth-it seems to bounce off some channels and lock on others for no reason. There is also an annoying 'chattering' sound when certain frequencies lock in. Any ideas?

Thanks...MikeM

A file containing the instructions AND codes to reprogram cell phones [NAMM codes not included *grin*] for quite a few popular models exists on a FTP site (I forget which). I remember reading the file, it had step by step procedures on how to do it.

I found this somewhere (I seem to have lost the uppercase):

---------- cut here --

General Mobile Radio Service (GMRS)
An Introduction

by Benn Kobb KC5CW (bkobb@access.digex.com)

on november 10, 1988 the federal communications commission released new rules for the general mobile radio service (gmrs), one of three personal radio services regulated by part 95 of the fcc rules (title 47 of the u.s. code). on the basis of the number of current licensees, the gmrs growth rate is one of the highest in the private land mobile radio services.

the new rules went into effect january 1, 1989 and added several enhancements to gmrs. they include interstitial frequencies and improved transient use (roamer) privileges. gmrs licensees use commercial-quality equipment but use gmrs for personal, family and volunteer public-service communications.

originally known as class a of the citizens' radio service (not to be confused with "citizens band"), gmrs was created in 1946 by an fcc that wanted to apply wartime radio technology to civilian use. the original spectrum allocation to class a was from 460 to 470 mhz. the fcc announced:

"the possible uses of this service are as broad as the imagination of the public and the ingenuity of equipment manufacturers can devise."

by 1949 the commission had clarified that it intended to restrict eligibility in the new service to those applicants who could not qualify in one of the other commercial/industrial radio services that it had established. still, the use of class a by businesses and organizations was permitted, and became predominant in the 1950s.

in 1957 the fcc answered the need to increase mobile radio capacity by consolidating several industrial services into a new business radio service. the agency reallocated the 460 - 470 mhz band from citizens' radio to the wide business category. as a form of compensation, in an action widely decried by radio amateurs, the fcc also reallocated 11-meter amateur spectrum to create the 27 mhz citizens band. it retained a small uhf allocation for gmrs.

other reallocation actions eventually left the gmrs with 16 primary frequencies (8 channels) at 462 mhz and 467 mhz.

in 1987 the fcc proposed to modify the gmrs rules to increase the service's flexibility for personal communications. high in priority was the unresolved issue of whether a small, personal-use service should continue to license parties eligible in the business and government services.

the "keystone" of its final decision, the commission said, was to limit eligibility for obtaining a new gmrs system license to individuals in order to encourage personal use and discourage commercial exploitation of the service. "business communications needs, particularly the needs of large volume dispatch operations, should be satisfied through the use of communications alternatives other than gmrs," the fcc concluded. "the gmrs is not and should not become the 'other' business radio service."

the new gmrs rules classify licensees into two categories: individuals and non-individuals. "individuals," for the purposes of licensing, are persons 18 years of age or older who are not representatives of a foreign government. members of an individual licensee's immediate family who live in the same household may be operators of the licensee's station. licensees' employees who do not themselves hold gmrs licenses may not operate gmrs stations licensed to their employers. after january 1, 1989, only individuals are eligible for gmrs licenses.

non-individuals include such entities as partnerships, corporations, associations, state or local governments or other legal entities. gmrs systems licensed to non-individuals before july 31, 1987 will be grandfathered. such systems can continue operations to the extent that they comply with all applicable gmrs rules, including channel sharing and station identification among others. there are several exceptions to the grandfathering rules and interested parties are advised to consult the rules and the personal radio steering group for the details.

the new gmrs rules granted increased privileges to licensees who are individuals. one of the longest-sought privileges was increased flexibility for roamers (or transient users). under previous gmrs rules, two parties could not communicate through a repeater unless at least one of the parties held a license for that repeater or a written cooperative-sharing contract with the repeater licensee. this requirement frustrated transient users, who wanted easier repeater access while traveling. even if the repeater licensee agreed to such operation, he/she did not have authority to grant oral permission to roamers.

with the new gmrs rules, the individual repeater licensee can grant oral or written permission to traveling gmrs users who do not otherwise have a licenses or contract for that repeater. this permission may only be granted to mobiles and not to control stations, and fixed point-to-point communications are prohibited. the gmrs national repeater guide, published annually by the personal radio steering group, lists repeater systems across the country, together

with access policies and contact information.

to make direct, non-repeater use in the service available the fcc released seven 12.5khz interstitial frequencies in the 462 mhz band to individual gmrs licensees. stations on interstitial frequencies may transmit with no more than five watts effective radiated power. the frequencies may not be used for repeater input or output; they are simplex only. no paperwork is required from individual licensees in order to gain access to these interstitial frequencies.

the new rules permit individual gmrs applicants to license for a maximum of two primary (25 khz) channels or channel pairs. the applicant must choose the channels to request; the fcc does not choose the channels, nor do part 90 (business radio) frequency coordinators have any authority from the fcc to coordinate gmrs frequencies.

in addition to the two primary channels, any individual licensee is free to use the channel pair 462/467.675 mhz for traveler assistance and emergency communications. if the user is licensed for that channel pair as one of the two primary channels, he or she is then not limited to traveler assistance and emergency content.

individual gmrs licensees are now able to use handheld and mobile transceivers as small base stations in gmrs. they may connect these radios to external power supplies and antennas. applicants must show their small base station on the license to be operated at a particular location, but need not supply geographic coordinates and heights. the small base station may transmit on the 462 mhz channels shown on the license, and on the new interstitial channels. base-to-base operation still is prohibited, and small base stations are limited to five watts erp and antenna no more than 20 feet above the ground, building or tree on which it is mounted.

the personal radio exchange newsletter, plus a wide variety of tutorials, licensing services and the national repeater guide and national gmrs licensee registry, as well as online access to the gmrs license database and user-cooperative contracts, is available from the not-for-profit gmrs advocacy organization:

Several feet to several miles, depending on propagation, antenna, and
sensitivity of the receiver. Many scanner antennas are quite insensitive
on the VHF low band.

I often hear the local police here in Monterey, CA say "Go to code".
When they "Go to code" they activate some sort of encryption device.
The freq remains the same, but I hear noise/static -no voice. After
what was a short transmission the units report "Clear code" and
everything is back to normal. My question is as follows -Is their a
way to decode this info? My guess is no, but thought I would ask.
Am I correct in assuming that this transmission it digitally encoded?

>b. Erie, PA
I know a few freqs for Erie, I used to go to school at PSU Behrend.
PS Behrend Campus Police are on 461.0250MHz
Erie PD Main Band is really active: 460.0500MHz
Erie PD Ax band is pretty active: 460.2000MHz I think
Use the 155.6700MHz and 155.9100MHz Combos for PSP on I-79.
Conrail on 160.8000MHz is also active.
462.9500MHz for EMS
155.2200MHz for Hospital - Not St. Vincent...the other one...
I may have my old freq list that I used to use from up there, drop me a
line at YT7062@ark.ship.edu if interested...

From: horak@convex.com
Message-ID: <horak.759769917@convex.com>
Source record: 277467

I've had my new toy for about a week now. The useable range is great, probably about 150 yards around my apartment complex. The range would no doubt be more if there were no obstructions. The sound quality is good for a cordless and there is very little noise. The popping sound people refer to when a line is ringing is not a problem. The phone does cut out when I approach the maximum range and there is occasional static then too. I can't get anything but noise on my scanner on the 900 MHz frequencies. My freq counter locks on just fine but all the scanner gets is white noise. One problem that has been mentioned that I have also noticed is that there is an emission from the handset around 448 MHz and a few other freqs in the 440 range. The unscrambled voices can be heard on these freqs but the power level at that freq is so low that I could not pick it up more than ten feet from the handset. Also, even at close range the voice signal is a bit noisy. All in all, I'd say the Tropez is a pretty secure phone. I'm satisfied with it, especially for $179. In our area, Home Depot or Office Depot is the place to buy them.

Yeah, the encoding is digital all right, and there is NO way the average person without a CRAY can decode the system, there are millions of combinations, and they can be changed at the drop of a hat. Most of the "Static" coders are Motorola units, tradename Secure-net. Capitol Police Department here in Harrisburg has that capability, but they rarely use it (except for when they filmed "The Distinguished Gentleman" downtown. Harrisburg PD also encodes, but they use Frequency Inversion instead. Just be thankful they don't code 100%!

>--
>Kenneth J. Morrill <kmorrill@brahms.udel.edu>

Using Coax (i.e. shielded cable) of most any type should eliminate most
of your problems. Power cords can also act like antennas to attract
interference, but this is less likely. Using torroids (ferrite) as close
to the radio as possible will usually help this. But most of the
noise comes in through the antenna - use coax and place your antenna AT
LEAST in another room (roof is better).

> is there on how to tune it?

I don't know abount the specific receiver. In my experience the most useful
device has been an insultation transformer (600ohm-600ohm or something close
to that) so to better insultate the receiver from the computer (for noise
reduction purposes).

Hmm, using a Hamtronics receiving converter on my FT-747, I can easily receive telephone handsets over a block away in my area. My antenna was a 2m 1/4 wave ground plane; a real 50MHz antenna would probably work a lot better.

I got such a kick out of hearing one of my neighbors, who is always very convservative in public, talking dirty to someone... :-)

714. Question on PRO-43 Mod

Newsgroup: rec.radio.scanner
Date: 1994-01-28 17:40:34 UTC
From: MCRoss@Haverford.edu
Message-ID: <MCRoss-280194124034@s131.stokes.haverford.edu>
Source record: 277457

I have read over the Cellular and Low-Band mods for the PRO-43. I am considering these mods, but I have a few questions.

First of all, the mod describes a row of five places for diodes, labeled D1-D5, with diodes in the D1, D2, and D4 positions. The mod says that if you remove D4 it will restore the cellular capabilities and if you place it into D3 it will extend the low band coverage. Does anyone know what D5 is for, or for that matter, what would happen if you removed or otherwise played with the other diodes?

Secondly, for anyone who has done this mod, what sort of tools should I get. Most of my tools are at home (I am at school) so I would probably buy new ones at the Shack (cause it's right down the street.) Should I get a 15 watt soldering iron, or is a 30 watt small enough. What kind/size solder should I use. I have never done much soldering, at least now with electronics. Is this out of my league? I can't afford to have a $350 paperweight with an antenna attatched to it.

Thanks for your help.

Michael

I recently bought a 200XLT over the net - it is modified for cellular and fast scan. I was thinking about the Pro 43 for a while because the cellular band restores to the correct frequency step of 30 khz. The 200XLT restores to 12.5khz. However, the 200XLT has a better receiver and better audio, and it

can easily tune in ALL cellular freqs. I love the 200XLT. One thing that is great about the 200xlt is that it can be easily modified to scan at 42ch / sec. Try to get that out of a pro series scanner. :-) The BC200XLT is the only way to go. (BTW, where did you see the $160 price).

717. TV Antenna for Scanner Use!

Newsgroup: rec.radio.scanner
Date: 1994-01-28 19:07:01 UTC
From: r_egeland@cc.colorado.edu
Message-ID: <CKCt3q.FA4@Colorado.EDU>
Source record: 277466

Just a little tip - I had an old tv antenna laying around (it was equipped for FM radio, too), and I decided to use it for my scanner. It's got the standard RS rotator. I first tried using the antenna just as it had been set up for TV, and it worked a lot better than the handheld antenna, but was not excellent. I then mounted the antenna VERTICALLY, and I can now recieve cordless phones from a half mile away or more, and I'm in the city! If you really want scanning power, just buy a cheap TV antenna with FM cap. and a rotator, and you can really see some scanning power for under $75!!! The rotator REALLY cleans up interference - as much as 5 degrees can make the signal crystal clear. WOW!

From: r_egeland@cc.colorado.edu
Message-ID: <CKCtrI.G3H@Colorado.EDU>
Source record: 277469

Other than soundblaster, are there any cheap DTMF decoders around? Where do you find them? I know there is test equipment available for around $300 that will do the job, but that's more than my scanner!!! Anyone have any creative/cheap ideas (besides recording and then trying to compare by pressing buttons on the telephone ;-)).

719. Pro-34 charger

Newsgroup: rec.radio.scanner
Date: 1994-01-28 19:36:53 UTC
From: jackson@longlast.cs.nyu.edu
Message-ID: <2ibpgl$jmr@slinky.cs.nyu.edu>
Source record: 277455

Good afternoon r.r.s.

I gave a Pro-34 to my girlfriend last weekend without the charger (oops). I found what I think is the charger I've always used, but upon looking at it, I think it read 9v 300ma with "for cassette players or radios without antenna plugs" Is that right? Can someone out there please confirm for me that the charger I'm about to give her is apparently not the correct one, or did Radio Shack make that charger before the specs for the Pro34 were set in stone?

Just a simple "use it" or "don't use it" by email would be fine..

Thanks much!
Steve

720. AR1000XLT for sale

Newsgroup: rec.radio.scanner
Date: 1994-01-29 00:30:47 UTC
From: mjr@crl.com
Message-ID: <2icann$hkg@crl2.crl.com>
Source record: 277473
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

I have an AR1000XLT I will sell for $275.

It is in perfect condition, used for about 1.5 years, and tuned about
6 months ago by ACE. It works great given the general limitations of
this particular model.

General characteristics:

1000 memory channels in 10 banks. 10 separate search programs also
can be stored (one per bank). The bank capabilities are very
flexible. For example you can program it to scan or search the
channels (or search ranges) programmed into several banks
simultaneously, even skipping banks in between, etc.

It's ostensible range is 500Khz to 1.3Ghz. There are no gaps. Nothing
is locked out. Bear in mind the unit is effectively useless below
30Mhz unless you can put a Loooong antenna on it... Above 30Mhz though,
it is pretty good. ..

It does AM, WFM, NFM modes. Any step increment from 5khz to 995khz
can be selected on any band. Unlike some scanners, it will not lock
to a particular even-increment when stepping. So if you start at
xxx.112Mhz and give it a step of 30khz, the next freq it will hit
will be xxx.142Mhz and not xxx.140 as with many other scanners.

All-in-all a very powerful scanner at $275 in prime condition. I also
have a copy of H. Bornstein's GUIDE TO THE AR1000 I will throw in
with the deal, along with all the original documentation and purchase
receipts.....c

If you are interested, call me at work (Larkspur CA) at 415 461-6790
or send mail to me mjr@crl.com

Happy scanning...

h> I recently purchased a Radio Shack Realistic Pro-2010 from a garage sale.
h> It works great, save no manual.

h> It's been a long time since I've owned a scanner, and a few buttons
h> I can't get to work. I have a monitor button, a limit button, and
h> an up and down arrow button.

h> Does anyone know what these do? Is it possible to program a lo and
h> high frequency(cies) and have it do a scan between them?

Hi, Matt...
Yes, it is possible to program a low and high frequency. The limit, up
and down arrows and monitor buttons are all used during a 'search'. To do
this, enter a frequency, press limit, then program a second frequency, then
press limit. Hit either the up key or down key depending on whether you
want to search up or down. If you find something of interest, press
Monitor. It is possible that this unit has a 10 channel memory bank to
hold frequencies that are stored after pressing monitor. The only way to
find out is to stop the scanning of the radio and press monitor. Look at
the top and see if there is an indication of what monitor memory channel
you are at.

Hi, Chris...

I don't have this particular model of scanner, but I can tell you what I
have heard from many users of the '43. The sensitivity is extremely strong
in the 450 to 480 Mhz range. Not too much you can do except maybe a
different antenna tuned to a different range.

There are a number of cheap IC's (<5$) that decode touch-tones well with little external circuitry. On example I know of is the Silicon Systems Semiconducter SSI202 an 18? pin dip. All you need is a color-burst xtal and a few resistors + caps to have an excellent decoder - the tricky part is the display - the chip has 8 outputs for the 4 rows and 4 colunms. Should be a simple project!

>I was starting to think that everyone who had started at Villa Olivia up and
>quit skiing! Then again w/ a 200' vert who can blame them?

I grew up near V.O. and went past it every day to and from school. I couldn't understand what anyone saw in this skiing stuff!! Why would anyone stand in those long lines for that 10 second slide down? As an adult my wife and my best friends conned me into driving them to Colorado and I learned to ski. Now I've come full circle, as I took my kids to V.O. this spring for their spring ski warm up before heading for the bigger hills. As I've heard others say - "A small hill's better than no hill" & "A bad day of skiing is better than a good day of work."

I would try to find TWO small irons!I've done 15 43's and two irons come in handy to pop off d4 instantly.You need a solder sucker(I personally hate wick), a small phillips screwdiver,solder of course,and good eyes or a magnifing glass.You have to realize the diodes are apox. 1\8th of an inch long!If that makes your knees shake,I'd say dont do it!I've seen a couple that were "modified"and didn't work anymore.I don't know actly where you are at,but it shouldn't be too hard to find somody in a scanner club in the area to do it for you or help you do it.It's not hard,but you have to be CAREFUL! And if you decide to try it,make SURE if you install d3,to get the polarity of the diode right(the stripe on one end goes the same way on all the diodes)! Good Luck!

> to get the information contained in the tones?

I guess you are referring to squelch tones. This is a system to enable
radios to receive only those signals that actually contain information
important to the listener. It solves problems associated with intermod,
etc. It is very advantageous for frequencies that are shared by various
agencies - for instance, medical dispatch in neighboring counties. The
system is called CTCSS - Continuous Tone Coded Squelch System.
Manufacturers have their own names for their implementation - Motorola's
is P/L (Private Line). I can't recall the others offhand.
What happens is that along with a broadcast, an agency specific
"sub-audible" tone is transmitted. The receiving radio listens for the
P/L tones and opens the squelch when it hears it. If another agency
transmits on the same frequency, they use a different tone to prevent say
Centre County to have to listen to all of Blair County's transmissions.
There is no "information" as such in the tones.

Anyone, please feel free to correct this if there are any errors, or add
to it.

733. Re: off subj: is there a faq list for GMRS?

My organization, Carnegie Mellon University Emergency Medical
Services is selling 2 Motorola P-100s V2 VHF handhelds. The freq. range
is 150.8 to 162 They have 1 watt(Low) and 5(High) watt outputs. Each
radio has 2 channels, with digital private line, duckie flex antenna, 1
battery that is 6 months old and another battery that is 2 months old.
Each radio comes with a holster to put on ones' belt. The radios were
purchased 4/16/91, I still have the original invoice. These radios are
presently in service and all in fine working condition. The only work
performed on these radios has been reprogramming. Each radio
set(radio,charger, holster,2
batteries) is going for $300 each. You can buy one or two.
In addition, we have 5 earphones specially designed for the P100.
These earphones are 10 months old. Each earphone is being sold for $20.
These radios are not in bad shape or worn-out by any stretch of the
imagination. We are being offered a chance to upgrade.

Any questions call 412-862-2815 or email me at jmb2@andrew.cmu.edu

I have all the tools indicated in the mods. In addition, I borrowed
my wife's tweezers, a magnifying glass will GREATLY HELP in identifying
the components. I didn't have one at that time so I just used
my camera lens :) Also, a Soldapult (suction for melted solder) tool
is a MUST. As for the soldering iron, I already have a 30 watt, but
I think smaller watts is better, but what I did was I just unplug it
when it starts to melt solder, and let it cool down for a minute or so,
worked just fine. just make sure the tip is nice and sharp, not blunt.

The most important thing to keep in mind while doing the mods,
"patience is a virtue". don't rush it.

good luck
jerry

738. AR1000XLT vs. MVT-7100 revisited

Newsgroup: rec.radio.scanner
Date: 1994-01-29 20:53:36 UTC
From: mjr@crl.com
Message-ID: <2ieicg$lm4@crl.crl.com>
Source record: 277395

Ok, so I joined the Yupiteru 7100 craze and got one of the critters. I also own an AR1000XLT which while it serves me well (from 30Mhz to 1.2Ghz) was never entirely satisfying. Even without SSB, I would have liked it to have a 1khz minimum step and not 5khz, and an S-meter sure would have made a big difference.

So now that I've played with the Yupiteru I ask myself is there anything the AR1000XLT can do that the MVT-7100 can not? Is there anything good that can be said for the AOR as *compared* to the MVT-7100? The answer is yes with respect to a few small items. Bear in mind that with respect to everything *important* like the ability to really bring in stations throughout its band spread, and resistance to interference of various kinds, the Yupiteru blows the AOR away!

Ok, so what's positive about the AR1000XLT.... A few things...

1) The mode and step settings are *entirely* independent of eachother and the frequency. This has *one* important consequence. When you set the AR1000XLT to an odd frequency (say 850.010Mhz) and ask it to search in 30Khz steps from there, it stops next on 850.040 like it should. The Yup, and others, will not permit you to search an odd step like that but will lock to the next nearest increment frequency starting with .000. The only way to overcome this on the Yupiteru (for really odd start points) is to use the 1khz step (which the AOR does not support).

Further more, you can search the frequencies above in WFM if you want! the Yupiteru will allow only certain steps in certain modes. Yes it is pretty reasonable, but still restricted.

This also means the AR1000XLT supports a true 30Khz step. The MVT-7100 can get to 30 only by stepping in 10s...

2) The AR1000XLT has more flexible scan and search bank joining capabilities. You can scan programmed frequencies in up to 4 banks at a time (or all of them) in the MVT-7100, but with the AR1000XLT you can link any number from none to all 10. The MVT does have a PROGRAM scan (really 1 program) that you can use to join up to 10 frequencies from any one bank across some or all banks, but this isn't as wide open as is the AORs ability in this area.

Not only can you join banks in any sequence (skipping any number as well) with the AOR, but you can also join SEARCH ranges set in different banks as well. The MVT-7100 can only SEARCH *one* range at a time.

3) Both units support only 1 priority frequency. With the Yupiteru, it is always the 1001 frequency (memory 1000) with normal memory ranging from 000 to 999. In the AR1000XLT, *any* frequency in any bank can

become the priority frequency.

4) Marking a frequency to be skipped/bypassed in SCAN or SEARCH mode is a 2 key function in the Yupiteru [FUNC]+[PASS], but a ONE key function (hit the lock key) on the AOR.

5) The *cost* of a new MVT-7100 is 50%-75% higher then the AR1000XLT. Used units have a better ratio. I'm selling my AR1000XLT (I can't afford both unfortunately) for $275, 63% of its new retail cost (and I'm including H. Bornstein's GUIDE as well). By contrast, even *used* Yutiperu's are going for $525 at least, about 78% of their new cost.

Well it isn't much, but that is what I have discovered. If anyone is interested at a VERY GOOD AR1000XLT at a very reasonable price, call me at work: 415 461-6790 x426, or email me here at mjr@crl.com.

Source record: 277344

I'm thinking of getting a scanner for my car - something smaller than Pro-2006, but with its reliability, number of channels, and frequency coverage. I've heard good things about the Yupiteru MVT-7100, but fiddling with it while driving seems difficult. My local dealer recommends the Yup MVT-8000, a mobil unit, 6.3" wide by 6.1" deep by 1.75" high, for $500.00 + tax. Is this a good unit at a fair price?

I was considering buying the AOR mobil unit (kin to the AR 1000 and 1500) but I understand the plastic case doesn't properly shield the unit from engine noise. Plus, the manual looked cheesy, and the backlight was weak (inportant for car use). But the size was right.

Any recommendations? Thanks.

info service? To: keating@nosc.navy.mil

> From: ur-valhalla!manta.nosc.mil!keating (Roger Keating)
> I read your post to rec.radio.scanner.
> I have no idea what a scanner info service is.

> Do you mind explaining to satisfy my curiosity?

Not at all. Scanner information services, or notification services, are
organizations that monitor public safety calls for certain geographic areas
and notify their members when a significant or major event occurs. Some such
services use two-way radio (mostly GMRS) and others send the notification via
alphanumeric pager. There are a number of such services on the coasts, and I
will post a listing of all such services that respond to the survey.

Can you satisfy my curiosity? What does a "Cognitive" engineer do?

Dave, NF2G

> 870.612

Nothing is "wrong" with your scanner. It just wasn't designed with
cellular scanning in mind. Actual C-phone channels are 30 kHz apart, like
this:

870.030
870.060
870.090
etc

746. Questions about air traffic terms

Newsgroup: rec.radio.scanner
Date: 1994-01-30 18:13:56 UTC
From: bjb@petrel.icd.ab.com
Message-ID: <1994Jan30.181356.13461@icd.ab.com>
Source record: 277393

I spent part of my weekend renewing my acquaintance with the airport frequencies at Cleveland Hopkins airport. (Having a PRO-39 certainly beats the analog Patrolman SW-60, although I can no longer receive several closely-spaced frequencies concurrently like I used to ;-).

Anyway, I was reminded of several questions I never bothered to answer. Sometimes when pilots are receiving instructions, they get something like 'contact xxxx, 126.7, squawk 5.' What does the "squawk" signify?

Also, occasionally, I hear commercial airliners give their designation as something like 'United 564 heavy.' My observation is that these are usually large aircraft, but I wondered what 'heavy' designates. Is this a plane loaded past a certain percentage of its capacity, or too big to use certain runway lengths, or what?

Best two exchanges of the day were:
1) a pilot asking permission to push back on a ramp that was cramped because it also being plowed at the time. Ramp control: "OK, push back but don't block gate 18--he's next out." Pilot: "Roger, don't block Charlie-18. If the driver does, we'll kill him." Laughter from ramp control.

2) another pilot calling for a pushback for the second time, upset that there was no ground crew anywhere on the ramp. The tower answered, "He's under your nose; there's a guy waving at you right now."
"Oh... Roger."

Anybody interested in the Hopkins frequencies I have can send e-mail.

We're experimenting with providing free public-access to our Informix database of FCC license information for radio transmitters located in California. The information should be accurate as of 09/30/93. More than 300,000 records are on file. Microwave, satellite, broadcast, and cellular records are included as well as business and public safety.

Telnet to: tcomeng.com
Login: fcc (no password)

VT-100 terminal terminal emulation is required. If there is enough interest, we will enhance the query interface and support other terminal types. You will need to carefully read the introduction in order to successfully use the database.

This service is provided in the public interest by Telecommunications Engineering Associates of South San Francisco, California. Send comments to fcc@tcomeng.com.

Source record: 277398

Well scanner freaks and fire buffs in Michigan here's what you've been waiting for: The Fire Notification Network of Michigan. For a minimum amount of fees to cover the costs of this not-for-profit service, you'll receive an alphanumeric pager with pages of major fire and police events in primarily the Metro Detroit area, with some from out-state.

Among events paged: 2nd alarm fires or greater from Detroit, all major fires from the suburbs, major hazmat situations, fire fatalities, mutual aid requests, explosions, and major police events.

Once you have the pager it can be used for personal use as well. In fact some former pager owners have switched to Michigan FIRENET only to find out that they're paying the same now as they were previously paying for standard numeric service without any great features such as scanner events.

If you're interested call Garry at (810) 772-4423 for more information. This line is usually answered from 5pm to 9pm Detroit time. If you call and no one answers, leave a message and you'll be contacted. Or leave a message for me here. This is a great service that's growing and growing. Its very similar to other nets around the country which for the most part have had great success.

Don't delay; with trunking and many, many freqs out there to listen to, you can't catch it all. This is a key to getting much more out of your scanners that would have otherwise been missed.

John M Morrison, Detroit, MI

: -Craig

Yes I own one. It was owned by someone else, but I have no absolute
proof the unit is reconditioned (if they do a good job, you can't tell).
I've been inside of it too. I have owned it about one month and have had
no problems at all.

It was backordered big time, but when they finally got it in they sent it
2nd day air. Got it on a Saturday and had the weekend to play with it.

Oh BTW, that "salesman at a local store". Would it have been Rad Shack
by chance (or soneplace else that sells lots of scanners)?
The person in that store does have a vested interest. :-)

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

756. Ham Radio FTP area on World

Newsgroup: rec.radio.scanner
Date: 1994-01-31 04:00:07 UTC
From: wy1z@netcom.com
Message-ID: <rec.radio.info-ham.radio.ftp_759988806@ve6mgs.ampr.ab.ca>
Source record: 277341
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.info,rec.radio.scanner

This is a periodic reminder that the Boston Amateur Radio Club maintains an FTP area on world.std.com (192.74.137.5) in pub/hamradio.

This area is accessible via: anonymous ftp, gopher, and World Wide Web (and possibly other methods I'm not yet aware of). World is not *fsp*-able yet (I asked them).

Via Gopher, the easiest path to the area is by selecting the following from World's main menu:

18. Membership and Professional Associations

3. Boston Amateur Radio Club

And go from there...

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail me.

Also, up-to-date copies of the files on the ARRL's information server (info@arrl.org) are available in the directory pub/hamradio/ARRL/Server-files.

All text files are uncompressed, so they are both retrievable and viewable via Gopher and World Wide Web. (If you have any troubles with any text file, please e-mail me).

Source code for programs is always welcome. It can permit people to use those programs on other computers with other operating systems.

Scott

Squawk: System to transmit the response frequency from aircraft to answer the inquiring frequency from radar in order to trace the aircraft more clearly on radar. Called a radar identification which is sent via squawk indent by radar operator when such response is required.

>> considering these mods, but I have a few questions.

I did mod last week. I didn't even try to remove the diode, I just
crushed it into oblivion with the tip of a small pair of needle nose
pliers. Everything works fine.

Diode 1 enables the keylock switch
Diode 2 enables 30-50 MHz reception
Diode 3 enables 54-88 MHz reception
Diode 4 locks out cellular reception
Diode 5 steps cellular bands in 12.5 KHz steps (30 KHz used in US)

Good luck and be careful.

>"squawk" signify?
The pilot enters the number ATC gives him after "squawk" on his radar
transponder which allows ATC to indentify him on their radar screens.

>
>Also, occasionally, I hear commercial airliners give their

>of its capacity, or too big to use certain runway lengths, or what?
You are right. Planes designated as "heavy" are usually widebodies-
747, 767, DC-10 etc. An important reason to designate a very large
plane as "heavy" is that they can create so much turbulence in their
wakes that a smaller plane can lose control if they get too near.

How's your antenna? The base radios are typically high level (antennas on the hills, etc), and very strong no matter what you're listening with. The mobiles, by contrast, are relatively weak by comparison. So monitoring requires not only some height, but a bunch of metal up in the sky as well (like a good multi-band antenna).

>"squawk" signify?
Squawk is the transponder code assigned by ATC. 0,1,2,3,4,5,6,7.
Transponder codes are four numbers.

B>Also, occasionally, I hear commercial airliners give their
>designation as something like 'United 564 heavy.' My observation
>is that these are usually large aircraft, but I wondered what
>'heavy' designates. Is this a plane loaded past a certain percentage
>of its capacity, or too big to use certain runway lengths, or what?
Heavy is any aircraft giving a wake tubulance of 300,000 pounds or
greater. B747,B767,B707,DC8,DC10,MD11.AB300,AB310,AB340,IL66 did I miss
any commercial aircraft.

The most interesting activity is the operation frequencies from 128.5 to
131.95.

765. vinyl case for MVT-7100 where to buy?

Newsgroup: rec.radio.scanner
Date: 1994-01-31 16:17:04 UTC
From: mjr@crl.com
Message-ID: <2ijau0$368@crl.crl.com>
Source record: 277342

Hello... I've called 3 scanner stores across the U.S. looking to order the vinyl case for the MVT-7100, and none of the stores I've called even stocks the radio! Scanners Unlimited in San Carlos CA. has them, but they are out of stock. I suppose I could call Radio Lorenz in Montreal, but I'd like to find a source closer to home (central California) if possible.

Does anyone have any suggestions? Where could I order the case and get it shipped second-day for a reasonable rate?

Thank you

|>
|> Jerry...Chicago

Then I'm confused. I've seen a BC200xlt stepping like this:

870.600
870.612
870.625
870.637
870.650
870.662
870.675
870.687
870.700

That looks to me to be 12.5khz spacing. What's wrong?

>* Member of the All-Ohio Scanner Club (OH-48-1859) * yah...

In theory, there is SOME truth to this. Cell towers receive from the
mobile station and transmit the othe side of the communication back to the
mobile. I'm sure you have heard conversations where only one side is
audible. The only reason you can hear the mobile side of the call is
because of SIDETONE (or BATTERY as it used to be called). This is just
the audio that is fed back to the earpiece so you can hear your voice on
the line. This is done so you have some feedback on whether you are
speaking loud enough. SO in theory, the cell tower doesn't REBROADCAST
the mobiles audio, it just happens because of the sidetone built into the
switching office equipment.

I too was hoping for a little different implementation. I noticed that
you must exactly match the Licensee name (MC DONALDS REST works whereas
MC DONALDS does not work) as it is in the licensee field.

I suspect that this is just an early version of the software and it is
still being revised. If this is so, a couple of features I would like
to see would be a secondary search criteria (do you know how many licensee's
there are for 154.6) such as city, zipcode, and maybe partial matches of
the licensee.

I do however realize that you (tcomeng) are providing a service and asking
nothing in return (cept name recognition). Thank you for providing this
lookup service.

tweek@netcom.com tweek@tweekco.uucp WWIVNet 1@511 DoD #MCMLX
I'd rather get my cable service from the phone company,
than my phone service from the cable company.

> time stamp.

I like the idea of digital recording and time stamp also but when I checked into Sony recorders they all had mic inputs for powered mics and I was not sure how that would effect just pluging good old audio into them. Instead Santa brought ne a Radio Shack with VOX (works with cable to mic input) and variable speed and pitch play back. It
uses standard cassetts and has a built in mic etc. I have been using it with good success to date. Sorry but I can't remember the model number and it seems that Radio Shack has a different catalogue here in Canada (usually less selection).
Hope this helps.

Carl from Sunny Shilo Manitoba.

Since Yupiteru does not have a US distributor, it is unlikely you'll find
any accessories for sale in the USA. Radio Lorenz, or Javiation UK have
the cases. Javiation also sells a custom made LEATHER case which is much
more durable.

Postscript to my previous post on this.
Design Eq in California (i.e. Howard Bornstein) sells the Javiation
leather case. Since you're on CompuServe, stop into Hamnet and leave him a
message. It'd probably be faster than ordering it from overseas, unless
you're stuck on the vinyl case.

774. Searching Military Air Freqs

Newsgroup: rec.radio.scanner
Date: 1994-01-31 18:20:21 UTC
From: scott@redstorm.nawc-ad-indy.navy.mil
Message-ID: <9401311820.AA03412@cs.utexas.edu>
Source record: 277424

Does anyone have any tips for searching through the military air band (225-400MHz)? I just bought a PRO-2006 and I don't have any specific mil-air freqs for my area (Indianapolis, IN). I have tried searching through areas 15-20MHz wide at a time. Should I break it up into smaller banks while searching? Wider banks? Maybe I just need some more patience.

I'm planning on purchasing the HB-232 computer-scanner interface, but that's a ways down the road. Until then, I'd like to hear some mil-air stuff. I did manage to get my local national guard freqs from a UH-1 Huey during our town's fall festival (copied them off the control panel).

Any help is greatly appreciated.

|>beats the analog Patrolman SW-60, although I can no longer receive
|>several closely-spaced frequencies concurrently like I used to ;-).
|>
|>Anyway, I was reminded of several questions I never bothered to
|>answer. Sometimes when pilots are receiving instructions, they get
|>something like 'contact xxxx, 126.7, squawk 5.' What does the
|>"squawk" signify?

The squawk code is a four digit octal number which is used to uniquely identify an aircraft within a given airspace. The secondary radar polls the transponder, which then replies with the squawk code (mode 'A') and the aircraft's current altitude (mode 'C').

|>Also, occasionally, I hear commercial airliners give their
|>designation as something like 'United 564 heavy.' My observation
|>is that these are usually large aircraft, but I wondered what
|>'heavy' designates. Is this a plane loaded past a certain percentage
|>of its capacity, or too big to use certain runway lengths, or what?

The official designation of 'heavy' refers to aircraft capable of takeoff weights of 300,000 pounds or more. There are a lot of reasons for the use of the 'heavy' designation, but one of the most important is for wake turbulance avoidance.

When an aircraft wing generates lift, it also generates a vortex at each wingtip. In general, the heavier the aircraft, the greater the strength of the vortex. The vortex of a 'heavy' aircraft can be strong enough to flip a smaller aircraft several miles behind it. Knowing you are following a 'heavy' aircraft alerts you to the possibility of severe wake turbulance, and requires a greater following distance.

Recently the NTSB and the FAA have determined that the Boeing 757 generates a tremendous vortex, even though it is not a 'heavy' class aircraft. This vortex is strong enough to have caused an uncommanded roll of 30 degrees or more in a Boeing 737 5 miles behind the 757. A recent bizjet crash has been traced to the wake turbulance of a 757 ahead of it. A notice to all pilots was recently mailed by the FAA warning of this, and ATC is providing greater separation between 757s and other aircraft. If you hear ATC announce "Caution, wake turbulance, a non-heavy Boeing 757 nn miles ahead", this is the reason.

776. Re: Freq Range of 43/46/BC200

Newsgroup: rec.radio.scanner
Date: 1994-01-31 18:41:12 UTC
From: cab@col.hp.com
Message-ID: <2ijjc8$of9@hp-col.col.hp.com>
Source record: 277326

> The following are frequencies of unmodified 43 and 46 - can someone
> tell me what they are for the BC200?

No, but I can tell you what MY unmodified 43 receives (or claims to):

YOUR Pro 43 MY Pro-43
Frequencies: Frequencies

034-054 30-54
118-174 118-174
220-512 220-512
806-823 806-823.9375
851-868 851-868.9375
896-999 896-999.9875

Maybe you just left off the .9x75 as a convenience in referring to those ranges, but that's almost a whole MHz each time - hardly fair to the 43. Don't know what happened on the VHF low - maybe a misprint, maybe you got some bad information. Or maybe it varies with the age of the unit?

Just thought I'd be excruciatingly accurate (there's a term for this) for those who like it that way...

777. Re: DTMF Decoders - Where?

>creative/cheap ideas (besides recording and then trying to compare by pressing
>buttons on the telephone ;-)).

If you are so inclined or would like to learn about electronics, a DTMF decoder can be built pretty cheaply nowadays. It depends on how "full-featured" you want it to be. If you just want a single digit display that shows the last digit heard, that can be done for about $20. If you want features like counting 7-10 digits, memory functions, etc., you need a microcontroller, the DTMF chip, some switches and a display. You also need the software for doing the development and some patience. I have done this and found it to be great fun. You may not. I don't know how electronically inclined you are.

There is an outfit that advertises a cheap DTMF decoder in Monitoring Times. You may check them as well. I think they call themselves MoTron or somesuch.

Hope this helps.

```
|> >What does the "squawk" signify?
|> The pilot enters the number ATC gives him after "squawk" on his radar
|> transponder which allows ATC to indentify him on their radar screens.

I was amazed the first and only time I've seen the transponder in use in
flight. I was flying with a friend in a Cessna 172 into Allentown-Bethlehem.
He called approach and estimated we were 12 miles out. ATC came on and told
him to "squawk with ident". He dialed up the digits on these four side by
side rotary knobs and pushed in a little button that read "ident" on it.
Before he could get his finger off the button, ATC came on and said, "okay,
cessna blah blah blah, we show you 17 miles out to the south east" and
started with the heading and alititude directions to walk us in. That's
quick.

If you ever watch public television, I think NOVA did an episode on keeping
sanity in America's skies. Good episode. A little dated by now, I'm sure,
but the technology seemed current enough to get a feel for what ATC's go
through today.

Now that you know what squawk means, you have a better idea of what happened
about five to eight years ago when we shot down the Libyan passenger plane.

We had ships over there that bragged about being able to pick up a basketball
from 1,000 miles offshore... and about being able to pick what rowhouse a
missle will hit that will destroy half a city. Well, as the airliner was
cruising north across the Mediterranean, we sent out a code that tells the
airplane's transponder to auto-identify.

It's still up in the air, but some people say that our ship picked up the
ident from Libyan jet fighters on the ground some 100 miles past the airliner.
However, our ship's computers identified the airliner as the fighter and we
creamed it. Others say Libyans don't know how to use transponders and had the
computers set in the airliner to identify the plane as a fighter. Too bad the
flight path was directly towards and over our ship.

Also, the made for t.v. movie about when our Pan Am airship was destroyed
over Lockerbie showed some pretty interesting scenes of London ATC where
they hand off planes to whoever controls the Atlantic.

><stuff deleted>

An aircraft is give a four digit squawk code that is entered into
a transponder. This allows a radar controller to see a box on his
radar scope that can have the call sign and type of aircraft in it.
(ie. The radar has a cross reference that code 1234 is a Cessna 152 tail
number N12345, and code 5678 is United Flight 432).

If it is a mode C transponder (most are), then the transponder also
sends the altitude of the aircraft back to the radar.

Most of these codes are taken from the Penal code, so there are thousands of them. There is a company that sells abridged versions of the calif. penal code, as well as vehicle code, narcotic codes and health codes. I think the company is called CODE-KEY (?? can anyone confirm?) I have several of their books and find them very useful. They are only about $10 each. If you are interested, and no one else on the net can confirm the company info, then I can look it up. Sorry folks but this is for California only. But, you should look up a local Cop-shop (police supply store) and see what neeto stuff they have!

> "squawk" signify?

It is a code that the pilot is instructed to set into his transponder. It should be 4 digits long.

> 'heavy' designates. Is this a plane loaded past a certain percentage

An aircraft weighing more than 300,000 lbs. The reason for the "heavy" suffix is to warn the controllers (and other traffic) that there should be extra spacing behind them.

A rule of thumb for all search operations on a scanner: The block size you search should not take longer to search than the expected transmission length.

For example, Mil-air comms are usually quite short, lets say 2 seconds. If your 2 limits take more than 2 seconds to search between, you MIGHT miss the traffic. I'm not saying that you will always miss it, but you might. You have to compromise. Maybe you are willing to search a larger block of frequencies since maybe there will be more than one active one.

As far as finding mil-air comms, your best bet is to ask someone in your area, or buy a book like Top Secret Frequencies by Knietel (sp?)

Hi everyone! If anyone needs police codes for Wasington DC or
Arlington and Fairfax Cointies Virginia, please e-mail me at
awp6f@poe.acc.virginia.edu. These are the "10 codes" used to
signiify such transmissions as DOA, crazy person, etc.

Andrew "no-sig-yet" Pang

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves by their sensitive baby monitor intercom. Yes, it's legal to listen, and it's all there in the 46 and 49 MHz ranges.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Scanners are available in two varieties: crystal controlled and programmable. The crystal controlled models are cheaper, but require the user purchase and install a $5 crystal for each frequency of interest. Programmable (synthesized) units are replacing crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crys-

tal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system.

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables.

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more

sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended

search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency

information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
world.std.com

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 1: Books, Magazines, Government Records, and Clubs

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Prelinger's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25.1 This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for

---

1. Grove Enterprises, PO Box 98, 140 Dog Branch Road, Brasstown, NC 28902. tel (704)837-9200

several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.2

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide.3 The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.4

---

2. Scanner Master, PO Box 428, Newton Highlands, MA 02161. telephone 1-800-722-6701.

3. Official Scanner Guide, PO Box 712, Londonderry, NH 03053.

4. Scan America, 430 Garner Drive, Suffield, OH 44260-1557

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)5. Only 12 of the 21

information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau",

indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'6.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

In 20 years of being an amateur radio operator, and belonging to amateur radio clubs, I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges,

---

5. See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.

6. See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.

there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

- 6 -

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall7, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

---

7. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

- 7 -

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army

Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

- 8 -

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much

like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a

county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm
Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them!8

---

8. One may use FCC license microfiche, described in Part I of this article, to identify stations using call

Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center9
Lisle, Illinois

I watched the driver pick up a microphone, and listened
to him on my portable scanner checking back with his

---

letters.

9. XYZ is a pseudonym for the actual licensee name.

"base".

All the pieces fit: the "guests", the "classes", the
"instructors". Mystery solved; I had been monitoring the
customer training center for a large computer manufac-
turer. The training center has hotel rooms and dining
facilities to accommodate students from out of state. As
a convenience, shuttle van service is provided to local
shopping malls.

Summary

Through books, government records, and radio clubs,
scanner listeners can make use of frequency information
compiled by others. Two-way radio users often fail to
identify their transmissions properly, making it more
difficult for listeners to know who they are monitoring.
By examining radio equipment labeling, and monitoring and
taping transmissions, scanner enthusiasts can unearth new
information.

You have discovered the bad side of Uniden's when mod'd for cellular.
The frequency spacing is wrong! The GRE's (PRO-39,PRO-43...) have
correct frequency spacing when modified.

I don't think that it is worth 120, but the pro43 has EEproms for the
memory, so that when you take the batteries out, you will never loose your
frequencies that you programmed.

: Comments... I take the 46 back in a heartbeat if you can tell me why the
: 43 is worth $120 more cash outlay.

: PS I do know what triple conversion is but is it worth $120?

The triple conversion scheme is only for the 800-900 band. It uses
a downconverter for 800-900 and converts them to 400-500 and then processes
them normally. A downconverter only costs 45 or something.

Recently there was an article in a newspaper
regarding this newsgroup which was very
interesting. However, my site does not
subscribe to this particular newsgroup.

Therefore, I was wondering if someone would
kindly email the INTRO FAQ ARTICLE for this
newsgroup (the one with specific info on
which scanners to buy, methods of scanning,
etc.)

Your help is very much appreciated. THANK YOU VERY MUCH!

To find out more about the anon service, send mail to help@anon.penet.fi.
Due to the double-blind, any mail replies to this message will be anonymized,
and an anonymous id will be allocated automatically. You have been warned.
Please report any problems, inappropriate use etc. to admin@anon.penet.fi.

[stuff deleted]

If the 46 does it for you, then keep it. I found that my BC70XLT (about 7 yrs old) is totally unusable around Washington, DC due to intermod from pagers. My experience has been that the 43 has much fewer problems. I also had a lot of trouble with cellphones imaging onto police bands (or, at least, I think that's what it was) and I haven't had the problems with the 43.

803. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-02-01 08:12:21 UTC
From: bill@thd.tv.tek.com
Message-ID: <1994Feb1.081221.3955@tvnews.tv.tek.com>
Source record: 277353
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 24-Jan-94]

This is a list of FCC license data sources available to scanner listeners. Please e-mail corrections and additions to me.

POLICE CALL

This is probably the most cost-effective source for public service license information. The detail is limited, but the information that is there is often more useful form than the raw FCC data. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the FCC master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

MICROFICHE

Lee Reynolds (lee@tosspot.sv.com) has made available copies of the entire US database on microfiche for $75 a copy. There are three sets in all - by callsign, geographic area, and frequency - for a total of about 200 fiche. His current set is from early 1993. E-mail Lee for more information.

The Bearcat Radio Club sells microfiche by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. The following data fields are provided: frequency, call sign, licensee name, service code, city, county, state, latitude, longitude. Grove Enterprises can be reached at 800-438-8155.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database called the FCC Frequency Retrieval System V2.0. Comes with FCC data for all services from 10 kHz through 2036 MHz in the state of your choice. Cost is $29.95. Demo copy downloadable from their BBS at 206-871-4228 (FCC2BETA.ZIP). ScanWare Associates can be reached at 206-698-1383

PERCON

PerCon sells FCC data on CD-ROM by state or by category for $100 per CD. The categories are divided as follows: public service & land mobile, common carrier, industrial, etc. The data is complete, i.e., it contains all of the

data in the FCC master database for the state or category covered.

PerCon has developed a CD-ROM of the entire US FCC database (approximately 3 million records). This product is now shipping. I will provide a description as soon as I get more information.

PerCon can be reached at 716-386-6015.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

I recently sent for this data and found it impressive. The 30-mile radius around Portland, OR (which CET does not consider a major city) contains nearly 10,000 records.

The data is more detailed than Grove's and isn't much more expensive if you need more than one state. CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude for the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. In my case, the server returned the coordinates of the main post office.

If you are interested in purchasing this data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. You do this at your own risk, however. CET can be reached at 800-445-0297.

The CET data records contain the following fields: transmitter frequency; service code; type code; transmitter latitude and longitude; call sign; transmitter output power; effective radiated power (ERP); antenna height from tip to ground; site elevation above sea level; number of vehicle, portable, aircraft, marine, and pager mobiles; transmitter city, county, and state; current expiration date; licensee name, mailing address, city, state, and zip code.

806. FRG-9600 scanner controller program with interface

Newsgroup: rec.radio.scanner
Date: 1994-02-01 12:52:06 UTC
From: asirene@ntuvax.ntu.ac.sg
Message-ID: <1994Feb1.205206.1@ntuvax.ntu.ac.sg>
Source record: 277358
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

This is the last call for anyone who wants a program for controllling the FRG-9600/965 using the CAT interface. Program includes circuit diagram for enhanced CAT interface which is compatible with the FIF-232-C from Yaesu. Does not require external power supply.

Program gives high speed scanning, 10 banks of 100 memories for 100 memories. 2 VFOs, 10 priority channels, stop on signal/squelch or both. Bank sort, band limits, band skip, VFO tracking, many different scan steps, description field in memory, pop-up TSR which continues scanning even when other DOS programs are running. Very simple and cheap to construct interface which fits into DB-9 or DB-25 casing. And a host of other features.

E-mail me and ask for it if you want.

Everything you need to bring FRG-9600 up to date with today's scanners.

73 de 9V Daniel

Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.info

---

Below is a collection of SW receiver reviews written by readers of Rec.radio.shortwave. The number following the brand and model number is the number of readers, who indicated they use this type of receiver.

All credit for these reviews should be given to the readers of this group and not me.

John Lloyd

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 - 1

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power

supply included.

An outstanding performer, and worth the price to a serious SWL
or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the
GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The
Sony is slightly smaller and has a somewhat more "finished" feel
about it. The Grundig is SOLID with a much better sound. Neither
is as good a SW signal receiver as the previous Sony, the '2010
(2001). However, they both have very advanced features;
multiple (and in the Grundigs case, expandable) memories with
alphanumeric tags so that you have a name as well as a frequency,
all sorts of memory grouping and scanning etc. The Grundig has
good RDS ident. on it's FM band, but I have a feeling that this
isn't used much, if at all, in the US. If you intend to buy
second-hand, be very wary of the SW77 - the early version was
pretty flakey. The later version is better but still not as good
as the '2010.
I think that the choice comes down to "feel". They are both quite
complex to use, but both work as advertised. Try 'em both as they
have quite distinct operational methods. If sheer performance on
SW is the main point for you, compare them with the Sony ICF2010.
You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the
Grundig. I have my Satellit 700 in daily use and it's performed
without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to
the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in
the set, which is how I have it set up. (The SW77 used C cells)
They both run down batteries fast. The Sony worse than the
Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer
heft of the Satellit. A Satellit with a full load of 4AH Nicads
can tip the scales at twice the weight of a SW77. Of course, if
drop one on your foot the Sony would be the better bet ! I
only use the Grudig about the house. I have a '2010 for the
road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following

message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700.
The sound from the radio is truely impressive! I have always
wondered why broadcasters put music on shortwave, because it
alway sounded like garbage. However with the 700 I can listen and
enjoy the music. The 700 has Bass and Treble controls, which
improve the sound quality but the Automatic Gain Control most
likely does the most toward improving the sound (I'm not an
expert, so this is just a guess!). Anyway my Wife
regularly listens to music coming from a 60m band radio station
in Guatemala, and can enjoy the sound. However there are some
bad points. It is programable, but I have not worked out how to
do it yet. Well I tried once and gave up. This is not too
bad though, because BBC, Deutche Welle, and about 10 others
are stored in a ROM table. And these frequences actual work
(i.e. they are the frequencies for North America and NOT
Germany).
Also I connected a long wire antenna and found my local AM
station on shortwave. I guess the front-end is not good enough to
sort the signals out when coming from a large antenna. But don't
worry about this either.
If you only want to listen to the biggies like BBC, Deutche
Welle, you won't need an external antenna. I am planning to put
a Pre-selector between The Radio and the Antenna, and I think
this will cure the problem of AM stations on shortwave and cut
out some interference. Finally I recommend this radio to you. I'm
sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is
still an excellent piece of equipment. Excellent sensitivity and
selectivity. Digital display with two separate clocks (only
one displayed at a time), signal strength meter, frequency
readout, and four-character user-definable "name" for each
memorized station. 42 memory positions. Tunes to .1 kHz
increments. Selectable wide/narrow bandwidth for AM mode
reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry.
In addition to AM, has three receiving "modes" for LW, MW, and
SW: USB, LSB, and "Sync," which should more accurately be
described as "fine tuning," as this implementation of synchronous
detection operates differently from the Satellit 700 or Sony
2010. Selectable automatic/manual gain control. Covers LW
(150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM
(87.5-108 MHz).
Excellent audio output, with separate treble and bass controls.
Stereo through headphones. Line-level out (mono), external
antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued,
many outlets are selling this unit at close-out prices, making
this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it.
I miss the 512 memories of 700 and 'SSB clarify' control
sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However,
it is rather simple to make it work similarly to '700 and '2010,
because the detector chip is the same in all three. Only a switch
with two pairs of contacts is needed. Another design fault, the
excessive distortion in SSB mode, can be partly cured by adding
two resistors. For serious DX-ers it may be important that the
internal ferrite rod cannot be disabled on MW and LW in both 500
and 700, so the in-house noise may become a problem on these
bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise.
Similar number of cubic inches as the Sony (different shape), but
offering some features of the R8. Also the Lowe is made with a
mostly solid alumnum case, which is better than the Sony or the
Drake. The Lowe has dual antenna inputs (wire or SO-239), record
out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes
8 internal AA nicads *OR* disposable batteries. It will recharge
the nicads with a builtin recharger if you plug it into
an external power supply. It's a nice semi-portable radio. It
has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with
it. I use it mainly for broadcast listening. It's connected to
25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial
and the coax, and on some frequencies it gave a (small)
improvement in signal strength, but it was such a pain to keep
retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to
offer the best of both worlds - improved matching between the
wire and the coax, but no retuning necessary. It's rather
expensive, though, and it may be that I'd have been just as well
off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of
tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments. No tuning knob but the slew tuning buttons work just fine. It's about the size of a paperback book and can be taken anywhere reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband filter work as one would want. The AM 455Khz ceramic filter is junk,

and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

YORX AM908 - 1

****
Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S iaN amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the first one I had,but not as much on the seconone.The first 525 I had would "click" on strong AM signals,but the new one doesn't.The main tuning knob spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!) All in all, a great reciever.

****
Japan Radio Company NRD-535D - 1

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE keys on the keypad. That should not happen on a $300.00 radio!

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

: out why some one would want to listen to "that's a big Mac, ...". Watching
: paint dry must really make some people wet thier pants.

Quite the contrary. I found one by accident, and while waiting for a
simple cup of coffee I could tell the two cars who had ordered before me
were going to cause a 15 minute + wait. I decided quickly (because I'd
heard the order/reply/sleepiness of the clerk) that maybe I should go
elsewhere. Had I not heard what was in front of me, I'd probably have
waited until I was fuming mad and then left. So now, I don't need blood
pressure treatment! :)

Actually - any radio broadcast has it's usefulness. Its up to the
listener to decide what that usefulness is. (and it's legality, of
course, disclaimer alert, etc, etc, etc)

810. Pro-43 cell mod info

Newsgroup: rec.radio.scanner
Date: 1994-02-01 15:54:09 UTC
From: fenno@jupiter1.mae.ncsu.edu
Message-ID: <1994Feb1.155409.16420@ncsu.edu>
Source record: 277362
Cross-posted to: rec.radio.scanner,alt.radio.scanner

First of all, thank you to all those who responded to my request for help on the cellular modification of my Pro-43. The modification called for removing diode D4 (which restores the cell band) and then putting the D4 diode in the previously empty D3 position (which extends the lower band between 54 MHz and 88 MHz). My problem was that I had damaged the diode in the process of removing it from the D4 position and, thus, could not extend the lower band. I realize that the extended frequency range is mostly just TV channels 2 through 6, but it still might be fun to go exploring.

The solution: I got in touch with the Tandy Parts center in Fort Worth. Their address and phone number is:

Tandy National Parts Center
900 E. Northside Dr.
Fort Worth, TX 76102.
(817)870-5600

I got a copy of the Pro-43 service manual for under $6.00 and a replacement diode for $1.22 (Mfr's Part No. MA110). They were very helpful and were more than happy to take my credit card number and send the stuff right out via UPS. It arrived in less than a week. The diode is now in and works just fine.

SORRY SORRY SORRY.

It's obiously not working, but I am trying to post a letter that I saved
that someone pointed out to me that My claim of the pro43 using a downconverter
is falsw.

I am wrong on that, and the pro 43 does not use a downconverter, but in
fact uses triple conversion for all bands that It covers, according to the
manual.

Any other comments are greatly appreciated.

Actually, that was just to test the system... Drive-ups indeed are rarely
exciting... although there may be other interesting things on the same
frequency... I remember one day in particular, after setting up some
audio-visual equipment for a conference at a conference center I do some
work at, I sneaked a peek at the frequency on the groups wireless
microphone and punced the frequency into my car's scanner... well, within a
mile from the conference center, I picked up three different transmissions...
the local McD's... the Dave DelDotto Conference, and the treat ;-) an
aerobics class at the local Health Club 1-2-3-breath ;-)

821. SCANNING CELLULAR "DATA CHANNEL"

Newsgroup: rec.radio.scanner
Date: 1994-02-01 20:43:36 UTC
From: bmcmulli@fox.nstn.ns.ca
Message-ID: <bmcmulli-010294164141@halifax-ts2-3.nstn.ns.ca>
Source record: 277276

On each cellular system their is a dedicated data channel (or signalling) that carries all call setup information. When a call is made to a cell phone the the switch send a signal out over the data channel to all sites in the system. This data is (I believe) in a digital format and of an unknown protocal. You can scan the voice channels very easily and when you lock onto the data channel it sounds like you are on a modem or fax line.

There must be a way to decode this information and read it?

Would be very interesting to find out because you could pump this stuff into a computer and see "whats going on in your area?"

Anybody know anything about this?

So far the only sources for MVT-7100 I've noticed are Javiation (in UK) and
Radio Lorenz in Montreal. No one ever considered other Canadian sources.
I am planning to purchase it and just wonders is that the only sources?
Here in Toronto I opened Yellow Pages, found few stores and all of them
had MVT-7100. I visited one and guy demonstrated me how easy it receives
Local TV news channel or cellphone conversations.
Does anyone purchased this unit in Toronto or area?
Should I stay away of local stores and ham radio clubs for some reason?
Should I order it from Montreal or so? Or maybe source of this model is
the problem only for US folks?
I'd appreciate any information about warranties and policies of resellers.

: Get yours before the new manufacture/import laws go into effect in April!

If you are interested in celllular, then the BC200 is a piss-poor choice.
It does not receive with the proper channel spacing - so some channels will
be distorted, and you are unlikely to even receive others.

==========
From: egurney@vcd.hp.com (Ed J. Gurney)
Subject: Cellular Data Snooper article in Nuts & Volts
Sender: news@vcd.hp.com (News user)
Message-ID: <CBwx9L.8J7@vcd.hp.com>
Date: Tue, 17 Aug 1993 16:46:32 GMT
Organization: Hewlett-Packard VCD
X-Newsreader: TIN [version 1.2 PL1.2]
Lines: 66

The August '93 Nuts & Volts magazines has a review of the CSI, the Cellular Surveillance Interface test set on page 81. It's a "little box [that] can do an awful lot when coupled to a good scanner and an IBM-compatible computer." I found it very interesting; I'm amazed that someone hasn't come out with a cheaper version with the wide-spread availability of cellular-specific ASICs out there. Below are some extracts from the article; see the whole thing for pictures and sample data output from the device.

The CSI "allows you to survey the messages being broadcast over a control channel or being spit out by a phone." The device is marketed by Spytech, a division of Electronic Countermeasures Inc. of Canada. "The CSI will interpret data on the control channel from any scanner capable of receiving wideband FM and delivering quality audio. Many stock scanners can be modified to provide this clean signal to the CSI. The firwmware outputs plain ASCII text at 9600 baud and could be used with a dumb terminal."

"In one mode the CSI follows the first call on the forward control channel directed to a voice channel. When the call is completed, the unit returns to the control channel and displays the overhead message data until another call is processed and handed a voice channel. Then that call is followed from frequency to frequency to frequency. One of the other CSI modes just displays all of the data streaming on the forward control channel and doesn't follow any calls. It can also be programmed to track voice calls when they involve a specific cellular phone."

"While the CSI can control an ICOM radio directly, it can also control other radios via the PC software when the radio is equipped with a serial port for computer control. Manufacturers such as Datametrics produce kits to add this feature to several popular Radio Shack scanners. The CSI is then connected to one of your PC's serial ports while the radio is connected to another RS-232 port." Spytech has modification kits and instructions for many scanners to get audio of sufficient bandwidth to the CSI, and includes the appropriate info with your order.

The device is available for US$394 until 12/15/93, including shipping and modification info for your radio if available. An info packet is available for $3.00. E-mail info is available via bill.fischer@t8000.cuc.ab.ca if you'd like an on-line reply. There address is Spytech, Division of Electronic Countermeasures, Inc., 65-31 Avenue South West, Calgary, Alberta, Canada T2S 2Y7.

If you want a copy of the EIA standard on the format of the cellular data fields, you can purchase the "Cellular System Mobile Station -- Land Station Compatiblity Specification" from:

Electronic Industries Association
Attn: Engineering Department
2001 Eye Street N.W.
Washington, DC 20006

Does anyone have any info on "Datametrics"? Is their kit for the Pro-200x any cheaper than the CommTronnics HB-2323 ($194.95 + $5 S&H)?

I use a 50 MHz ringo style antenna I picked up at a local ham swap meet.
I didn't really try to fine tune it but used the instructions and extended
the element to full length. Works far better that the ICOM discone. You can
aslo try monitoring the extender VHF frequency for your area. Ours is
154.905 MHz

Jim

PS: To anyone who used to call the SAC BBS in Orange, CA, a new one using
Wildcat will be up with an 818 area code as soon as I get the phone line
installed.

Back on May 13th, I published an article on USENET about a SWAT incident that involved using my home as a command post.

Several readers suggested that I send the article to Monitoring Times or QST. I really did not think that either publication would have any interest in it, but since it was already written, I sent it to MT with a note that I can clean it up if they were interested.

They said that they were and would pay me $75 plus a year's sub, if published. They also said not to rewrite it too much or it would lose the spontanaity.

So, I cleaned it up & resubmitted it. It is on page 27 of the February issue. Thanks to those that suggested that I publish it!

It is very true.

>Delta now lets you run scanners except at takeoff/landing... ...some carriers
>seem not to mind shavers, PCs, radios... Some seem to ban them. There appears
>to be little consistancy.

There is a technical committee working on that.

>Given the huge amounts of RFI already existing, especially around airports,
>(some flight paths are quite near multi-hundred megawatt xmitters) I wonder
>what the facts are. Is there any non-anedotal, scientific information on this
>topic?

Yes, but you can't have it. :-) Seriously, the FAA and AvWeek have
published gobs on the subject. From an aircraft systems point of view, let
me give you my two cents worth.

The navaids come in all varieties. Some have a coax that runs from the
antenna (typically near the midbody of the aircraft) to the box in the

rack, some (like the ADF) have a box near the antenna and run unshielded wires in tracks under the floor and sidewalls in the passenger cabin to the box in the rack. The box in the rack is right underneath the first class cabin in most airplanes. Some aircraft have boxes in racks in the cabin with the passengers (Fokker 100 for example). All of you EE types should be familiar with the possibility of cross talk between and unshielded digital device such as a consumer-class CD player and another digital system running through unshielded wires.

Aircraft flying by multi-megawatt transmitters are the subject of HIRF testing, a recent and very expensive certification requirement. However, the inverse square law works in your favor here, where it wouldn't with a portable computer or CD player in the cabin. BTW, a cellular phone is considered to be the most hazardous consumer electronic device on board the airplane, and there are a number of documented incidents involving their influence on the navigation systems. I think they may well be involved in the rash of rudder hard-overs on landing that commercial carriers have experienced lately. (Airplane is landing, the busy traveler sneaks out the cell-phone to confirm the rent-a-car or tell Boopsie he has arrived - BTW, he didn't believe the cabin crew when they asked him not to use his phone on the airplane until it arrived at the gate.)

For those who didn't catch it, airplane wiring is rarely shielded. Shielding is very heavy (and there are several miles of wiring in every airplane these days) and costs the airlines in terms of more fuel burned to haul it through the air, which in turn costs the consumer more for the ticket (or makes the airline lose more money depending on your paradigm).

From: rflood@cis.umassd.edu
Message-ID: <CKMr5K.4pE@umassd.edu>
Source record: 277306

I was wondering if anyone knows of any software to keep track of
freq's. I took a look in the usuall places and haven't found anything.
I was wondering if anything like this exists.

I have my states scanner master book and know about their on-line
version. But $100 database + $60 program is kinda steep since I
probably won't use 5% of the freq's in it. I would like a program that
would manage my local freq's though. If anyone can point me to such a
thing I would appreciate it.

Thanks in Advance!!

I asked here about a week ago regarding a case for my MVT-7100. Someone was kind enough to suggest I contact Howard Bornstein on CIS. His ID is 76174,637. His company is Design Equilibrium in Menlo Park CA. at (415) 328-9181. He has both the stock [Yupiteru] and his own leather cases for sale. Both are 27.95 + shipping & tax. He is at this time out of the vinyl cases, but has some of the leather ones.

There are advantages and disadvantages to both.

The vinyl case protects the radio much better from dust, moisture, etc. It has plastic windows over the display and the keyboard, and a flap that hinges over the top of the radio with holes for the nobs and BNC. I've seen both cases now and over all, I'd say the vinyl one is a better deal.

Except.... The vinyl one is very thin, not much of a physical shock protector. The leather case is thick, 1/8 inch of heavy leather. It will obviously protect the radio better from physical shock, but there are no plastic windows over the display and keyboard, only open holes (appropriately sized of course), and no top flap. One further problem, it fits very snugly. So tight in fact that the designer provided a finger sized hole on the bottom to help push the case out. It is *so* snug however that I can't even push it out with my finger. I have to prop the radio on a cylinder of some kind (the diameter of the hole) and push down on the case (hard) to get the radio out far enough to grab it and pull the rest of the way. I hope it loosens up with use!

OK, so any of you who know me (and I know at least one of you who does :-^)) know I'm into function, even if it's tacky... I cut a piece of plastic out of a reletively thick sandwich bag, sized it just right, and taped it over the case with some scotch type tape and it seems to work fine. It has the added bonus of protecting the switches on the left from dust as well. Don't know how durable my hack will turn out to be, but it is easy enough to replace (if you have the plastic and tape handy).

So how about the radio? Its great... I won't extend this post to 200 lines extoling its virtues. Is there any place on the net containing documentation for undocumented features?

I have been a member of the Bearcat Club for over a year. They maintain a BBS with a database on frequencies nationwide. This is really helpful if you don't want to buy a book for an area. They also have a DOS based program with the same info for your own pc. Each state is purchased as a separate disk. Members pay somewhere around $10 per disk. You can combine several states into your own database for states you need. Canada is available as well. The publication is produced every 2 months with articles related to scanning and a few frequency updates. I find the club to be worthwhile for the price, and I do recommend it.

Bad news for anyone wanting a BC200XL from Damark...they're out.
I called last night to get more information on it and the guy
said they had dicontinued that model. He went on to search his
computer for other comparable scanners. They have a base scanner
(BC700A) and another handheld (BC100XLT), in addition to some
other model which priced at over 400 dollars (I didn't bother to ask
for a model number). At any rate, they're out of the 200.

857. Scanner Info NEEDED

Newsgroup: rec.radio.scanner
Date: 1994-02-03 15:14:54 UTC
From: gt8303a@prism.gatech.EDU
Message-ID: <135932@hydra.gatech.EDU>
Source record: 277314

Hi all. I've got a few questions for anyone who can help me out.
I called Damark about their Bearcat 200XL(T?) last night, and discovered,
much to my chagrin, that they had discontinued that model. That led
me to ask about other scanners that they had, and I got a little more
information. Now I need to know about the scanner they suggested.
It was the BC100XLT. I don't know where all the frequency bands are,
but my primary interest is listening to military aircraft, since I work
right next to an air force base here in Atlanta (we can see the tarmac
from our labs). My questions are these:

- What are the frequencies used by military aviation?
- What scanners do you know of that receive these frequencies?
(ie, does the 100XLT?)
- What are some good places (read: relatively cheap) to look for
a good scanner for this purpose?
- Is there anyone out there with a good scanner that they want
to sell (of course it must get mil a/c)?

I thank you all very much for any help you can provide. Please e-mail
responses to me at gt8303a@acme.gatech.edu or reply with a follow-up
article here, as I generally read this group. Thanks again.

You should purchase The Directory of North American Military Communications
(I think that's the correct title) by Sullivan. There are four regional
editions for the US. The directory is very accurate and will give you
lots of frequencies including bases, air-air refueling, tactical comms, etc.
Except it does'nt list base ground freqs for maintainance, etc but these
can be found in another book which I can't remember the correct title of--
something like Directory of US Military Installations--the author is
D. Symmington. You want the 2nd editions of both books. Both are
available from Grove Enterprises and also EEB.

This may be obvious but remember when using the 2006 to change to AM when
entering most 225-400mhz freqs.

Good Luck!

From: eswails@hubcap.clemson.edu
Message-ID: <2j0hvg$ilh@hubcap.clemson.edu>
Source record: 277190

I just recently purchased the BC 200XLT as my first scanner and I
like it alot. Here are the frequency ranges out of the manual:

29.0 - 54.0 MHz
118 - 174 MHz
406 - 512 MHz
806 - 823.9875 MHz
849.0125 - 868.9875 MHz
894.0125 - 956 MHz

The 200XLT is 200 channels (ten 20 channel banks).
It has a scanning speed (channels you have programmed in) of
15 channels per second and has a search speed of 25 frequencies
per second.

Hope this helps.

In a previous article, w644171c@edinboro.edu () says:

>What is the upper and lower limits to the Cellular phone band, and is it
>a 12.5 STEP NFM?

Rumor has it that the cell output frequencies are between 868.940-896.000
MHz. Spacing in USA is 30 KHz-this may be different in other counties.

I'm sorry I can't answer your question, but I do have one of my own.
I'm going to visit your county in March and thought about throwing my
portable scanner in the suitcase. Before I do, though, I'd like to know
if Australia has any laws prohibiting the possession or use of scanning
VHF/UHF radios. I don't want to begin my vacation with a hassle with
your Customs service.
Thanks for any advice and G'day (that's what they say isn't it? :-))

Hello all...

I have a couple of questions that weren't addressed in the available faq.

My scanning roots came from my father's old Zenith with a manual dial. Not much compared to what you can buy today, but at that time it was top of the line. I gained an interest but computers took over my free time and haven't really thought about it for years. Well, now I would like to get back into the hobby and buy a new scanner. I was in a Radio Shack and looked at one of their mid line models. I have never been a fan of 'Realistic' so I'm definetly going to look around, esp. at Uniden/Bearcat before I make a purchase. As for my questions:

1. Are there any sacrifices in going for a portable instead of a desktop model? Features, sound/signal quality, or scanning speed, for instance?

2. Is it a good time to buy a new scanner? Meaning, are there some new models coming out soon that might be worth waiting for? And what about legal issues -- when are some (cell phone?) frequencies going to be restricted and not going to be in the new scanner models?

3. Why are there two scanner newsgroups: alt.radio.scanner and rec.radio.scanner?

4. What are some good models in the Uniden/Bearcat and ICOM (?) lineup?

All comments/advice appreciated. Thanks much.

The 7000 is the =old= model.
It's like a 7100 with fewer channels, and no SSB coverage.
It's like an AR-1000 with better performance and less complicated
programming.

I have a BC200xlt. I would like to use an earphone with this unit, but due to the jack, I have to use a mini adapter. The problem: the mini adapter has to be wiggled on occasion in order to hear. Is there a recommended headphone to use with the correct jack on it? Is it common for the BC's to have this problem with the earphone jack?

>
I have absolutely no idea!!
> 4. What are some good models in the Uniden/Bearcat and ICOM (?) lineup?
>
IMHO,there are NO good models made by Uniden!The place to go as far as all around good performing scanners is.....RADIO SHACK!The Pro-2006 and the Pro-43 are currently the best all around scanners under 600 bucks!The new JUNK from UNIDUM should never have been released!Intermod,images,birdies galore!THe Pro-43 is "the king of Cellular".I have modified 16 of these and the only complaints I have are:

1.Display too small
2.Light sucks!
3.Weak audio.
The funny part is,the Bearcats do 1,2,and 3 well,but as far as radio performance goes they suck big time.The "realistics"(made by GRE,Japan)are the kings as far as decently priced radios go.The icom R1(handheld)is a dud,especially for the price.Only 100 ch.,the scan\search speed is slow,intermod is terrible,and low freq performance is pitiful.The Icom 7100 is a great radio,and a "fair"scanner,it has some piculiar things that dont make it a great scanner,especially when it costs 1200+!Btw,if you go to Radio Shack,dont even think about a scanner called the pro 46,it is a UNIDEN scanner and a piece of crap!Another thing,dont buy your scanner from your local RS, unless it's on sale,AND you have to have it TODAY.There are lots of mail order places that will save you $40.00+tx on a 2006,and more than $50 on a pro-43!Email me if you dont know where I'm talking about.Well,I hope I've helped,and kept you from making a BIG mistake!

>The mistakes you see on my posts are due to a crappy modem!!

The best way to receive cordless phone freq's is to use one yourself. I use my Sony SPP-70 the following way. The SPP-70 has a 10 channel selector button which makes it great for monitoring. Just unplug the phone line from the base, select channel 1-10 and then discoonect the power from the base and away you go. I altered my handset with an amplified version of an appropriate 46-49 Mhz antenna, so I pick up everything within a good half mile. Happy monitoring.

Listening in on cordless transmissions does have its attributes. You can find out if a girlfriend is cheating on you (if she lives close by), or for the mobile approach, use a 12V connector
for your car and give your girlfriend a cordless phone as a gift. I gave a girlfriend one and I found out enough shit to make her and x-girlfriend pretty quick.

-the prying ear.

891. Cordless tel monitoring the right way

Newsgroup: rec.radio.scanner

From: hansen@next1.scri.fsu.edu
Message-ID: <2j2n4q$q4v@mailer.fsu.edu>
Source record: 277187

Let's face it. You spend $600 on a good scanner, hoping
to get in on the real meat and potatos of the freq range,
46-49 and soon 900Mhz, are a source of awsome info. But did
you know 99.9% of scanners can hardly pick up the 46-49Mhz
range? Well if you enjoy, or would like to find out better
info on how to do this, use what was engineered to operate
in this range, the handset!
I bought a Sony SPP-70 just for this purpose. It has
all 10 channels and you can surf through them with the press
of a button. To monitor, just get to your channel, unplug the
phone cord first, then the power. You'll get great range,
and if you do freelance P.I. work like I do, you can take
it on the road provided you have the correct 12V adaptor for
your car.
I have compared it to all my scanners and the handset
takes the cake.

* INTRODUCTION

This document is for your information and entertainment and while I won't mention all the Frequencies that one can explore, I will give you some hints and tips to help you get started in the constantly changing world of Scanning which is exciting listening. This information is reasonably accurate although frequencies are always subject to change as Counties add new radio systems.

I have listened to communications for 26 years. I started before Scanners were invented. Back in the sixty's we used tunable radio's where you would tune in the station you wanted to listen to. Of course they had to be talking or you would tune bye the Frequency and naturally Digital Displays hadn't been invented yet. We didn't have a Squelch on some radio's so we heard the signals with hiss between transmissions and back then only the expensive radios had a squelch. As a young person, I first heard the Boston Fire Department, when visiting a friend and I was so fascinated that as soon as I could afford a $30 tunable set from Radio Shack called the patrolman, I snapped one up. It ran on a 9/volt battery and back then they didn't make adapters so they didn't plug in although I eventually solved that problem with mine by buying an "Electric Battery" which is a 9 volt battery with a chord sticking out one end. Many sets of batteries were consumed and these little radios had the standard A.M. (amplitude modulation) Broadcast Band, and either Low V.H.F. which is F.M. (Frequency modulation) range 30 to 50 Mega Hertz or High V.H.F., 144 to 174 Mega Hertz range and in those early days we didn't have U.H.F. which stands for Ultra High Frequency. What great memories for me and I heard thousands of Fire and Police calls as well as Mobile Telephones and the latest New England Weather during blizzards and hurricanes.

Scanners first appeared on the consumer market around 1972 or so and the first one I ever heard was a Bearcat210. This was a 10 Channel Programmable Unit and it did have lower and upper limit search as well as delay and lockout, but it's sound was noisy. The early processors had a high whistle when the signal was on and this was the first Scanner I ever owned. I eventually bought other Scanners from Bearcat and Regency which were better as they improved and got rid of the bugs. Today's Scanners are truly excellent sounding and they work perfectly for the most part.

I bought my first portable Bearcat in 77 or so and it was a hansom all metal unit and I used it on the streets of Boston and on their subway with an earphone and it worked fine. Unfortunately it was stolen in 81 or so. It had 16 channels. Many of the early Scanners were crystal controlled. You bought a crystal for each Frequency you wanted to listen to and the store ordered it for you. A Crystal has to be cut to a Frequency so that it will match that Frequency or it doesn't work and if it is a hair off the station won't sound correct. It is like listening to an A.M. station that is not tuned in properly and you plugged in these crystals in to slots in your Scanner. I

understand that other types of Scanners such as those that were set with Dip Switches were also manufactured in the early days but I never saw one of these.

* GETTING STARTED

The first thing you need is a Scanner. Several companies make Scanners including Unidend America, Makers of Bearcat. They can be reached at 800-297-1023 from 8-30 A.m. to 5 P.m., Eastern Standard time.
Also Grove Enterprises of Brasstown, North Carolina sells Scanners at discount prices by mail. I checked but couldn't locate an 800 number for them, however, I know they have one but it is not listed interestingly enough. Bob Grove also sells shortwave radios and other equipment relating to the radio hobby and he puts out a magazine called Monitoring Times, however, he has never put it either on tape or in braille although I have asked him to do so.
Radio shack makes a number of fine Scanners from a 10

channel programmable unit to a 400 channel unit. The 10 channel unit is a base unit and I tested one here not so long ago. It isn't to bad but it doesn't cover the 800 and 900 M.H.Z. ranges. It's cost is around $100 as I recall. Their top of the line 400 channel unit costs $400 or so although now is a good time to buy as the end of the year sales are on. You may be able to pick up a bargain during this time or whenever these units go on sale.
Another source for information about the Scanner hobby is Internet where you can read and ask questions about Frequencies and radios. You can get opinions on the best radios and whether they are any good. On Internet you should read alt.radio.Scanner and rec.radio.Scanner as we discuss all issues of the hobby from the latest equipment to the FCC forcing manufacturers to drop Cellular coverage from their models and Frequency books are also available.

* WHAT CAN I HEAR ON MY SCANNER?

If it's business related it can be found on the Scanner bands most likely. You can hear all kinds of stations from Fire, Police and Ambulances, to Cabs, Railroad, Cordless Telephones, Ships, Hams and Weather as well as Government and Aircraft and much more. I suggest that you keep your Squelch just below the noise level. If the Squelch is to tight, the weaker stations won't come in and your Scanner will scan past instead of stopping to hear the action.

* DO I NEED A SPECIAL ANTENNA OR LICENSE TO LISTEN?

You surely don't need much of an Antenna to lick up the signals since many signals are designed for wide coverage areas. Just your Whip supplied with your base Scanner or the Rubber duck

supplied with a Portable Scanner will do the job nicely in most cases. Like any F.M. radio it is important to put your Scanner in a spot where you will get the best reception. Try for a high table or window sill. If you have a portable unit as I do, I recommend picking up a telescopic Whip from Radio Shack which will improve your reception. This aluminum antenna has a BNC connector on one end and I recently purchased one of these for $11. I found here in Oakland that it improved the reception quite a bit, especially on V.H.F. I heard the Space Shuttle from the ham radio repeater at Moffett Field, on 145.585 much clearer once I put this new antenna on my Pro34 200 channel Portable Scanner.
Another accessary that you may want if you have a Portable Scanner is rechargeable batteries. This way if we have an

Earthquake or the power goes out you can find out what's happening and why.
You don't need any license to own or listen to a Scanner, however, you may not record what you hear. This is a violation and if caught you could be in serious trouble. Lets take a further look at this issue. You may have heard about the princess of England and how someone recorded a Cellular conversation that she supposedly had concerning a love affair. Naturally that was unethical for a journalist to record her and then use her conversation, however some people will do anything for a story. Now they are going to sell Scanners without Cellular coverage because of this whole issue and these new Scanners are supposed to be on the market by April of 94.

Personally I feel that if it is out their we should have the right to hear it as long as we don't rebroadcast what we hear. Another example is that many of my neighbors have Cordless phones. While I don't listen often, I occasionally tune in to hear what my neighbors are chatting about. This is certainly legal as long as I don't record, broadcast, or blackmail my neighbor over what I have heard. It is honest for me to listen if I choose because these phones transmit on the radio spectrum between 46.600 and 46.995 M.H.Z.
I could use my Scanner to commit other crimes such as

Robbing banks or setting house's on Fire etc. Now I am not stating here that these things are done every day but I am saying that in Today's world anything is possible and as long as I don't do these sorts of things I should be able to listen. Many Police Departments scramble many of their transmissions and many Departments are now going to the new 800 Trunked Radio System to keep the person who is intent on committing crime from listening.

* BIRDIES AND INTERMOD, WHAT ARE THEY?

Birdies are either internal carriers generated by the

processor inside the unit or external carriers such as those buzzes generated by TV picture tubes.
Intermodulation occurs when the radio's front end is overloaded by extremely strong signals such as data signals. Usually you can solve this problem by either changing Frequency or tightening the squelch.

* HARMONICS, WHAT ARE THEY?

In most radio processors, they use the 21.4 conversion technique which means that you can hear the same signal twice during your search. Examples of this are: TV channel 2 news on 450.3375 which is the correct Frequency or 21.4 M.H.Z. above that Frequency which would be 471.7375 M.H.Z. This Frequency will come in well but not as well as the proper Frequency, however there are times when you may want to go to a harmonic Frequency. For example if a birdie is bothering the main Frequency you may try the harmonic which could solve the birdie problem for you. If the signal on the main Frequency is weak at your listening post, you may not hear it's harmonic. Keep in mind that harmonics are 21.4 M.H.Z. above the main Frequency so don't convert 21.4 below the main Frequency or you won't hear anything. This applies primarily to the U.H.F. section of your radio.

* HOW ARE THE BANDS BROKEN DOWN?

30 to 50 M.H.Z. is the low V.H.F. business band. Some stations use this spectrum and this spectrum goes in .005 M.H.Z. steps. For example the band would go: 30, 30.005, 30.010,

30.015, 30.020, 30.025, 30.030, M.H.Z. etc.
50 to 54 M.H.Z. is the 6 meeter ham band and also is tracked in .005 M.H.Z. steps.
Regular F.M. is broken down as follows: 88.1 to 91.9 M.H.Z. which is the non commercial portion of the spectrum reserved for Public Radio Stations and Stations serving University's. The F.M. band goes like this" 88.1, 88.3, 88.5, 88.7, 88.9, 89.1, 89.3 M.H.Z. etc. The portion of the F.M. spectrum from 92.1 to 107.9 M.H.Z. is reserved for Commercial Broadcasters and this band is tracked in .02 M.H.Z. steps as this is the proper spacing for F.M. You couldn't have a station at 92.2 or 92.4 because the signals at 92.1 or 92.3 would be squeezed out.
The portion above F.M. from 108 to 118 is for Military Aircraft and the portion from 118 to 136 is for Commercial

Aircraft and can be found on most Scanners. This band is tracked in .025 M.H.Z. steps.
The portion from 136 to 138 M.H.Z. is for satellite Weather stations and you would need all kinds of other equipment besides a Scanner to receive these pictures. This band is tracked in .005 steps.
The F.M. portion between 138 to 144 M.H.Z. is for the

Military. This band is tracked in .005 steps.
The portion of the spectrum from 144 to 148 is for ham radio, (2 meeter) use. This band is tracked in .005 M.H.Z. steps.
The portion from 148 to 150 is used by the Government and is for Military use. This band is tracked in .005 M.H.Z. steps.
The V.H.F. portion from 150 M.H.Z. to 174 M.H.Z. is a

general business band although the F.C.C. has allocated certain portions for certain services. This band is tracked in .005 M.H.Z. steps with the exception of the Marreen Band which is tracked in .025 M.H.Z. steps. Examples of how this band is broken down follow and I don't want to confuse you so I will keep this as simple as possible. When using your search limit keys on your Scanner it is a good idea to use a farely narrow limit. This way you won't be confused about where the signals are that you hear and I recommend tracking in 100 M.H.z. steps. You should be sure that the delay is on in this section of your radio so you have 2 seconds to press the hold key so that you can either read or identify the station that is transmitting. I usually track from 150 to 151 M.H.Z. or in that style and if I am looking for new stations to hear I track during the business day or rush hour.

* LOW V.H.F. INFO PLEASE?

Here are some examples of how you may find certain groups of stations. I'll explain the low V.H.F. band which is 30 to 50 M.H.Z. first.
33 to 34 M.H.Z. is allocated for Fire Departments such as Concord and a few Nets. A Net means many Departments sharing the same Frequency. Try these Frequencies; 33.920, 33.940, and 33.960 M.H.Z. I have heard traffic on all these Frequencies from Oakland. I think Concord is at 33.100 M.H.Z. but I am not sure, however, search between 33 and 33.500 and you should come up with the station. I can tell you that they use a fine sounding

repeater. For other Fire Departments on the low band try these; 46 to 46.500 are the search limits. There are Fire Department Frequencies at 46.060 which is Richmond, 46.100 which is Moraga, 46.380, 46.400, 46.460 and 46.500 M.H.Z. I have heard Fire traffic on all of these Frequencies from here but I can't tell you which towns or cities these are.
Other good places to look on this band are; 39 to 40 M.H.Z. where you will find Police Departments, 42 to 43 where you will find the Highway Patrol, 44 to 46 which has some Police Departments including; 45.100, 45.140, 45.420 and 45.580 which are San Francisco Police Frequencies. Also search 46.600 to 46.995 for cordless Telephones. On 47.420 and 47.540 is the Red Cross Frequencies which become active in times of disasters. Channel 1 is for San Francisco and Channel 2 is for the East Bay. Finally search between 49.600 to 49.995 M.H.Z. where you may hear

the transmit Frequencies for the Cordless Phones as well as Baby Monitors.

* WHAT IS HIGH V.H.F.?

The High V.H.F. band is a long one and so are the ultra high U.H.F. bands. We will now discuss the high V.H.F. portion of your Scanner from 150 to 174 M.H.Z. which is grouped like all the bands by the F.C.C. according to type of services for the most part. There are exceptions to this rule but they only apply if there isn't enough Frequency space on a particular band. All stations on the business bands have to have a radio license in order to broadcast. Any employee of a company may use the

business radio for that companies' use as long as the language is kept clean and proper business practices are followed. The F.C.C. lays out the V.H.F. band this way:
From 150 to 152 M.H.Z. you will find low powered stations that don't need a lot of coverage range. You also will find the U.S. forestry Fire Nets here. To hear them Scan between 151.200 and 151.500 M.H.Z. I have heard these Forestry Nets; 151.295, 151.325, 151.370 and 151.445 and these Nets are from Morgan Hill. 151.295 is a Plane to Plane Frequency and is active whenever the hills here in Oakland and other areas catch Fire.
152 to 152.245 is a utility band and is dedicated to paging services both voice and data. 152.265 to 152.495 is reserved for the dispatcher side of Cab Companies. 152.500 to 152.820 is reserved for Mobile telephone communications. Note that these services have either a fast busy signal or a high whistle when not in use and these stations are not Cellular in nature but are land point to point stations.
153.600 to 153.740 is reserved for P.G&E. services such as P.G.&e's Electric service for San Francisco on 153.650 M.H.Z. Now from 153.750 to 154.450 you will find lots of Fire Departments. Here's a list and I will tell you if I know the towns where these Departments are located. I hear all the

Frequencies that I will mention from here. Some signals are weak as they are either up north or down south but I have heard at least the dispatcher on all of these Nets. With the Fire danger here in the Bay Area you may way want to have these Departments in your radio. I listen to them all as I have 200 channels here. Try These:
153.755 which is the radio shop I believe, 153.770 which is way down south in the Mountainview area, 153.830 which is Berkeley Fire Channel 3, 153.890 which is a South Bay county Fire Net, 153.950 which is San Mateo, Hillsboro and Redwood City Fire Net, 154.010 which is San Jose Channel 1, 154.025 and I don't have any info but it is a good sounding repeater from here but weak, 154.040 which is also unknown and weak here, 154.070 which I believe is San Leandro, 154.100 which is Daily City, 154.130

which is Alameda, 154.160 which is the Sacramento North Fire Net and it can be heard here with farely good reception, 154.190 which is Berkeley channel 1 and they just installed an excellent sounding repeater on this Frequency, 154.220 which is unknown but I do know that it is a repeater, 154.235 which is the reserved channel for Berkeley Fire and this Frequency is also repeated, 154.250 which is Santa Clara and Santa Crues areas, 154.265 which is the White Fire Net for the South Bay and also 33.960 seems to be a White Fire Net for the South Bay area, 154.280 which is the White Fire Net for the East and North Bay area and 154.295 is another White Net for either the South or North Bay, 154.310, 154.340, 154.370, 154.385, 154.400 and 154.415 are all Fire Departments that I have heard traffic on but can't say which channels use them.

154.450 to 156.300 has a variety of services on it mainly some Police and Ambulance services. Try 155.07, 155.130 and 155.475 for the Police County Frequencies and 155.100, 155.160, 155.250, 155.280, 155.295, 155.325, 155.340, 155.385, and 155.400 for Ambulance traffic. 155.400 here in the east bay is a jamming channel for the Ambulances responding to the different hospitals. You can hear the Pinole Police on 155.190 and the University of Berkeley's busy Police Department on 155.445 M.H.Z.

The portion from 156.300 to 157.300 is reserved for water craft of all types and this portion is the only portion that has been laid out in .025 M.H.Z. steps. For example; 156.300 is channel 6, 156.325 is channel 66, 156.350 is channel 7, 156.375 is channel 67, 156.400 is channel 8, 156.425 is channel 68 etc. This is slightly confusing but this is the way they have laid out the bands. Certain channels are used by barges, large Cargo Ships, the U.S. Coastgard, or Pleasure Craft. Channel 16 at 156.800 is a good one to have in your Scanner because it is the Calling channel for all crafts to use. Channel 12 at 156.600 is a good one to have in and you will hear the San Francisco Coastgard giving ships notices about water hazards. Channel 22 at 157.100 is a Search and Rescue Frequency. If you want to hear ship to shore telephone search from 161.800 to 161.995 M.H.Z.

157.500 to 157.700 is for the back side of Cabs. In other words the Cabs themselves. Cab companies use a split radio Frequency, that is the dispatchers transmit on 1 Frequency and the Cabs transmit on another Frequency. An example would be Desoto Dispatcher in San Francisco on 152.390 and their Cabs on 157.580 or 585 M.H.Z. I have found the best way to set up Cabs is to put the Cabs in a separate bank of channels with no delays. I put Oakland Yellow which is located at 152.360 dispatcher on channel 141 and their back side or the Cabs themselves on channel 142 on Frequency 157.620 M.H.Z. without any delay on either side so as soon as one side stops talking the other side starts and the Scanner will hear the signal. Split Frequencies are common for some services such as the Highway Patrol 42 to 43 M.H.Z. Also bus companies such as A.C. Transit and San Trans use split

Frequencies.
158.200 to 158.400 has a couple of P.G.&e. Electric services
for the East Bay. Try 158.235 for Oakland and I think it's
158.320 for Berkeley. The Electric Department is handy if your
lights and equipment fail do to power loss and you will hear the
crews talking on their radio's as they locate the problem. It
beats getting a busy signal on the phone when the whole
community, who don't have Scanners' are jamming the phone lines.
159 to 160 has lots of Frate companies such as U.P.S. Try
159.445 and 159.495 for U.P.S. trucks and dispatcher calls.
Other frate services also use these Frequencies so use your
search keys.
I hope that this Information is useful to you and as I tap
the computer keys, we have a long way to go yet. Every Frequency
I have given you so far, or just about every Frequency, I have
heard traffic on. The next section is long but it covers
Railroads such as Amtrack, Southern Pacific and Bart. While I
have heard traffic on many of the following Frequencies I can't
validate all of them. I just received a chart listing Railroad
Frequencies that I haven't heard myself yet but as I type in the
chart on the computer I also am going to type in every Frequency
on the Scanner. I have ridden down to San Carlos and
Mountainview on the Train and have listened to their radio's. I
Love listening to Railroad traffic. You should note that these
bands are laid out the same way all over the country so if you
have a Portable Scanner you just need to program it and while
Frequencies will shift a bit you can Scan in areas and hear the
traffic for the services all over the country just by using your
limits. The Fire Nets and Cabs and Railroad Frequencies are
pretty standard. For example 153.950 which is San Mateo Fire
here is also Sacramento Fire up North.

* RAILROAD FREQUENCIES PLEASE?

#2 djc 3k
From: BENJAMIN COIFMAN <zephyr@cory.EECS.Berkeley.EDU>
Subject: Re: rail freq in SF bay area
Date: Mon, 13 Dec 1993 14:37:04 -0800

Thank you for the extended information on the rail frequencies.
Since I
received your letter, I posted on rec.railroad and got the

following
response:

I'm also new to the area and I haven't spent a lot of time

listening to the
Scanner, but here are some of the frequencies the NRHS Central
Coast
Chapter put on a card they handed out at their last meeting:

SP Road 161.550 (Oakland to Roseville)
SP Road 160.320 (Oakland south, Roseville east
SP PBX 160.890, 160.950, 160.275, 161.220 (Systemwide)
Oakland Amtrak Terminal 160.440
Oakland Carmen 160.980
Oakland Yard 161.100, 161.430, 160.470
ATSF Road 160.650
ATSF PBX 160.245, 160.425, 160.335
ATSF MOW 161.010
UP Road 160.515
UP PBX 160.290, 160.605
UP Oakland Tower 160.680
UP Oakland Yard 160.380, 160.530, 160.620
Oakland Terminal 160.935
BART Road 160.410
BART Yard 160.455
Caltrain Road 160.815

Hope this helps....

So, I will merge the two lists together. It is nice to be able
to sit
at my desk typing away at my homework and be able to listen to
the
railroaders do their job. Sort of calming. Up until I moved to
Berkeley,
I have always lived with in two or three blocks of a rail line.
Now it
is about three miles. But I always smile when I hear the Amtrak
horn
echoing through campus. So, I am a die hard.
I am a member of three rail road museums in the area. If you
ever get
the urge to visit any of them (Western RR museum in Rio Vista,
Pacific
Locomotive Asn in Oakland and Niles canyon, and Golden Gate RR
museum in
South SF), let me know and I would be glad to show you around the
back
yard(s).
Merry Christmas to you too.

- NP 328 - Benn Coifman

Thanks Ben who I met through the Internet. The only
Frequencies that were not on that list were; Bart channel 2 which

is underground repairs and problems to the trains on 160.860 and Bart channel 3 which is train to train communications at 160.445 and Bart Police on 453.150 M.H.Z. Also S.P. Police on 161.200 and 161.400. There are a couple of other Frequencies for the Railroads such as 160.725, and 161.070, as well as 161.370. Happy traveling with your Scanner. I just put all these Frequencies in my radio and I think it worked out to 32 channels or so.

* WEATHER AND GOVERNMENT?

You will find the weather stations at either 162.400,

162.4750, or 162.550 M.H.Z.
From 163 to 174 is classified as Government. You will find some government stations, however, many of these have been

scrambled by White noise and can not be heard properly. Try 163.410 for the U.S.G.S., 165.240 for the U.S. Customs, 165.375 and 164.650 for the Secret Service. Some transmissions from these stations may be scrambled but I think that some of them are not so give them a try.

* U.H.F. INFO?

We will now discuss the U.H.F. Portion of your scanner. There is plenty to hear on these bands. My Pro34 starts at 380 to 512 M.H.Z., 806 to 823.9375, 851.1125 to 868.9375, and 896.1125 to 960 M.H.Z. As you can see there is a lot of space for stations on these bands and these bands don't seem to be allocated the same way as the V.H.F. portions in terms of grouping, however, certain portions are grouped to some degree.

* HOW ARE THESE BANDS BROKEN DOWN?

380 to 440 is all Government and is tracked in 12.5 M.H.Z. steps. 440 to 450 is for Ham Radio Use and is tracked in 12.5 steps. 450 to 960 is Business's and is tracked in 12.5 steps, thus it would look like this: 450, 450.0125, 450.0250, 450.0375, 450.050, 450.0625, 450.0750, 450.0875, 450.1125, 450.1250,

450.1375, Etc. U.H.F. stands for Ultra High Frequency and from 450 to 469.9875 is U.H.F. where as 470 to 512 M.H.Z. is called The T Band. The bands at 800 and 900 are just called The 800 or The 900 M.H.Z. Band. These bands are also broken down in 12.5 M.H.Z. steps. The new digital cordless phones are between 902 and 903 and 926 and 927 M.H.Z.

* GENERAL TIPS AND HINTS?

I have read that the Presidents communications can be heard between 414 and 416 M.H.Z. 435 to 437 is Space Shuttle Frequencies. 450 to 451 is for TV News Crews. 451 to 452 is Utility stations such as P.G.&E. Gas Services and the Pacific

Bell Line Repair Crews. 452 to 452.500 is the Cab Dispatchers. 454 to 455 is for Data and Mobile Communications. The back sides of repeaters, from 450 to 469.9875 M.H.Z. are 500 M.H.Z. above the repeated frequency. For example, if you put 452.400 in your radio, you will hear the dispatcher side of Metro Cab here in Oakland. If you want to hear the cabs you need a second channel at 457.400 M.H.Z. Again this is the split frequency principle and you don't want the delay turned on. I recommend a separate bank of channels for split frequencies.
On the T band, 470 to 512 M.H.Z., the back sides of repeaters are 300 M.H.Z. steps above the main frequency. Say I hear a repeater at 471.2125 and want to hear just the mobile unit. I can tune to 474.2125 and hear the mobile unit. You only might do this if either a channel is split or you want to see if a mobile is close to your listening post.
Police Frequencies are all over these bands. They can be found almost anywhere except where allocated by the F.C.C.

* ANY HOT TIPS DON?

Try these: 450.0625 for Metro Traffic, 450.0875 for K.C.B.S. Radio, 450.2125 for K.G.O. Radio, 450.2875 and 450.4625 for K.G.O. TV, 450.3375 and 450.3625 for K.T.V.U. TV, 450.4125 and 450.4375 for K.R.O.N. TV, and 450.5125 and 161.690 for

K.P.I.X. TV. There are plenty of other stations in the 450 to 451 and 455 to 456 M.H.Z. bands and you can hear remote broadcasts from K.F.R.C. at 450.750 which is the studio to remote on air link, or 161.700 which is the studio to remote regular talk link.
Try 451.300, 451.350 and 451.400 for Pac Bell. Also try 453.150 for Bart Police.
Try 460.075, 460.125, 460.350, 460.450, 460.300, 460.525, and 460.550 for San Francisco Police.
Try 488.3625, 488.5625 and 488.7625 for San Francisco Fire.
Try 460.600 for the Hayward Fire Department and 488.4125 for the Fremont Fire Department.
Try 482.8875, 484.5125, 484.6125, 484.7125, and 31.140 for Muny.
Try A.C. Transit on 490.5125, 490.6125, and 490.7125 split frequency except for 490.6125 which is a repeater. The back sides are 493.5125 and 493.7125.

* FAST FOOD TO GO?

Try these for fast food drive up windows:
Arby's: 30.840, and 154.570.

Burger King: 31.000, 170.305, 457.550, 457.5625, 457.600,

457.5750, 460.8875, 465.8875, 467.7750, 467.7875, 467.800, and 467.8250.

Hardee's: 30.840, 31.000, 154.570, 170.305, 457.550, 457.5750,
461.1125, and 466.1125.
Kentucky Fried Chicken: 30.840, 31.000, 154.570, 170.305,

457.5875, 460.8875, 465.8875, 462.7625, 467.8125, and 467.8875.
McDonalds: 30.840, 31.000, 33.140, 33.400, 35.020, 151.895,
154.490, 154.570, 154.580, 154.600, 170.245, 170.305, 171.105,
457.550, 461.0375, 466.0375, 463.2875, 468.2875, 464.5125,

469.5125, and 467.7750.
Taco Bell 30.840, 154.570, 460.8875, and 465.8875.
White Castle 461.8125, and 466.8125. These frequencies are
nation wide according to Internet where I obtained this chart.

* FINAL NOTES

Thanks for viewing this document and whether you are a first
time scanner owner or have listened for years, I hope that you
found this Information of some value.

Note: I can be reached through Internet by writing to
djc@terapin.com. If you have questions You may write to me on a
number of computers here in the Bay Area. Under djc you can drop
me E/Mail on Club California, (510) 724-5755, (510) 724-1071,
(510) 724-1275, or (510) 724-7123. You can also leave me E/Mail
on Terapin Transit at (510) 644-9328, (510) 486-1537, (510)
644-3770. Remember on these systems to send mail to djc.
Using the name Don Coco I can be contacted on Baytalk, (415)
864-6430, The K.A.L.W. BBS at (415) 641-4373, or SF/Net at (415)
824-8747 or (510) 450-0155.

HAPPY LISTENING.

According to the Motorola technical manual, the towers transmit between
869.030 - 893.980, on 832 channel AMPS/NAMPS systems.

Sound like you have a bad connection Dave. You may try to use a chemical
called Stabilant22, a contact enhancer. You can always find a set of
hearphones you like and change the connector to reduce the stress on the
earphone jack. I have a 200xlt and never had such a problem.
good luck , Dino. dino@cam.org

895. DTMF Decoders - Wher�����

I keep seeing references to programs that work with a soundblaster card
but to date, I have never seen a listing of such programs.

Could someone give me an idea of which programs they are and what they
do?

Thanks,

Derek (who is studying for his ticket)

Correction: it is about a guy in Texas (Steve Douglass) who
monitors military aviation traffic, and sometimes jumps to conclusions
(regardless of whether or not they end up being right or wrong) that he's
hearing "still-secret military aircraft."

What the heck are you talking about. I have a $99 scanner with a 5 mile
reception rance on cordless phones. You are crazy!

899. TEMPEST - Electronic Eavesdropping

Newsgroup: rec.radio.scanner
Date: 1994-02-06 21:08:33 UTC
From: R.O.Jackson-SE1@cs.bham.ac.uk
Message-ID: <2j3m8h$m6j@percy.cs.bham.ac.uk>
Source record: 277201
Cross-posted to:
rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.policy,rec.radio.scanner

Transient Electromagnetic Pulse Emanation Standard (TEMPEST) is the US standard defining the amount of electromagnetic radiation that a device may emit without compromising the information it is processing.

In the US it not illegal to posess TEMPEST-surveillance equipment but it is illegal to take appropriate counter-measures to prevent surveillance. The US government has refused to release details of its TEMPEST research and has restricted the dissemination of independent research by classifying it.

The US Drug Enforcement Agency (DEA) makes use of TEMPEST secured electronics and computers as they believe that the drug cartels may possess surveillance equipment.

I am interested in gathering comments on the social, legal, ethical, and technical aspects of use of TEMPEST surveillance equipment in the US and Europe with the aim of including it in a discussion of the threats to computer/digital systems.

Please reply by E-mail. I will provide a summary to anybody who requests one.

thanks, - Rob Jackson

(more information on TEMPEST can be found in the paper "Eavesdropping On the Electromagnetic Emanations of Digital Equipment: The Laws of Canada, England, and the US" by Cristopher Seline - available on FTP from csrc.ncsl.nist.gov)

900. Radio Shack Pro-51 Scanner!?

Newsgroup: rec.radio.scanner

I just saw the new RS Pro 51 scanner at a local (bay area) RS. They wouldn't open the case and let me look at it (some nervous newbie) and they didn't have any info on it (they wouldn't let me see the manual either.

Anybody have any info on this scanner?

It has what I consider neat styling - thin and then a buldge near the top for the LCD display. About the same size as the Pro 43. Has buttons marked Wx (weather), Air, and Marine. Has hyperscan, but I don't know how fast that really is. The price was $299 which make me think it wouldn't be as good as the Pro 43, but then again it has a higher model number.

A last thought, this may be the new Pro 43 replacment that can't be modified for cellular.

=Beech=

No. It's the replacement for the PRO-39. Made by Uniden.
(GRE got type acceptance for a re-worked version of the scanner we call the
PRO-43, late last year. Whether that will surface as a "pro-43A" after
April is anyone's guess.)

Early reports say it's got better immunity to intermod on VHF-hi than the
PRO-43. Also it takes 4 AA cells instead of 6. One user said he was
getting images of aircraft comms in the VHF hi band, and images of
cellular traffic in the high 800's. Nobody, to my knowledge, has yet
tested the impresison that the cellular lockout can be undone.

This scanner doesn't tune the mil air band, just like the PRO-39 doesn't.

Forget it Richard. The TV antennas are tuned to the wrong freq. for the scanner. If you go to Radio Shack and plunk down $50 you can get a great scanner antenna that will increase your range by 10 times over your built-in antenna. Or even a mobile $15 antenna will help quite a bit.

>You might also talk to the Ottawa politicians about this.

I agree that the police should not scramble ALL there communications.
Listening to there communications give the citizens they WORK for a
wealth of infornmation. Listening to the police bands during storms
give people an idea of what roads are frozen, flooded, ect .... It
also gives people an idea of what is actually happening in there
city/town.

I can only speak for myself, but listening to my local police opened
my eyes to how hard my local police dept. works. They know people can
listen and simply use beepers and telephones to provide more secure
lines of communication.

However I doubt that the police see scanners the same way. It will be
a sad day when police do indeed scramble their communication to
prevent people from knowing what really is going on. Maybe some
communities will see scanners in a more positive light and require
departments to have scrambled and un-scrambled freq's. Does anyone
know if any communities has taken this approach?

In no way does that equate to it being illegal to attempt to
suppress spurious electromagnetic radiation from computing devices. The
FCC even has rules requiring EMI/RFI filtering & suppression for
civillian & commercial computers & peripherals, albeit not in the name
of national security.

>The US Drug Enforcement Agency (DEA) makes use of
>TEMPEST secured
>electronics and computers as they believe that the drug cartels may

Yes & no. Some DEA processing machines contain or are capable of
accessing classified information. That alone requires the machines and/or
their containing room to meet certain TEMPEST criteria. The classified
info is what necessitates TEMPEST, and not specifically the belief that
narcotic organizations are using Van Eck devices, etc.

You can try these - possibly some have been changed by now. The list is sorted by service and user, but you can resort by frequency to see what range you want to search on your scanner.

Have fun, and if you see the F-14 in Iranian Air Force scheme, give it my regards.

How do the 7100 and the 7000 compare in receiving on frequencies
they both cover?

For SSB and 800 more memories I think $200 is a lot of money.

916. Viewing Webersat TV signals

Newsgroup: rec.radio.scanner
Date: 1994-02-08 14:09:50 UTC
From: wai@iai.mv.com
Message-ID: <760716590snx@iai.mv.com>
Source record: 277224

Has any scanner hobbyist or ham tried receiving live tv views from WEBERSAT
in the following configuration:

440 Mhz ANT--->CABLE TV BOX TUNED BETWEEN CH59 and 60--->Home TV

Basically, the above diagram shows a Cable TV Box hooked up to an
external ant where the cable signal is normally plugged in. The cable box
is then tuned between 59 and 60 where there is on-the-air ham band tv.
The output of the cable box is fed into the big screen TV.

Before I do this at my house, can anybody comment on the quality of the
signal from space? Can I use a discone antenna?

Also, has anybody with a high end scanner (with video output jacks of course)
receive Webersat xmissions.

For the newcomer,
Webersat is a ham satellite that sends live TV pictures of Earth as it
flys over your area. (Don't ask me for Keplerian elements. Get them
from Compuserve or local BBS)

Thanks,

Wai Hom - WB3BHT Imaging Automation, Inc.

I beg to differ. If one has access to a log peroidic VHF-UHF antenna, it makes great use as a beam! Only one problem, to pick up most 2-way communications, it would be extremely benefical to vertically polarize the antenna (i.e. turn the antenna 90 degrees).

I use an old VHF-UHF log peroidic with great success. And it only cost me the price of 40ft of RG-8-Sat. My parents switched to cable about 10 yrs. ago, and ever since, the old 'aerial' hasn't been utilized. However, now it sometimes picks UHF repeaters at 60 miles (even more when there's band openings).

Point is, if you or a neighbor has one of these antennae 'laying' around, they can be a cheap external antenna that works extremely well!

I see what you mean. In my previous post, I logged in anonymously
successfully, then moved to the proper directory without 'doing' a dir.

I just tried again, and while I was able to move from dir to dir, I was unable
to get list of the files in any directory. 0 bytes transferred at 0 bps.
Whatever. This site must be offline for awhile!

It almost sounds like an "off frequency" problem. Can you tune -+5 KC from
the frequency? In other words, if your display is reading "154.19". Can you
punch in "154.185" or "154.195"?

This may help.

920. Antenna in Attic?

Newsgroup: rec.radio.scanner
Date: 1994-02-08 16:38:48 UTC
From: lenny@pmafire.inel.gov
Message-ID: <1994Feb8.163848.23733@pmafire.inel.gov>
Source record: 277228

Having recently purchased a PRO 2006, I am now in the market for an antenna that will enhance my scanners performance. Radio Shack has an antenna that covers 50MHz- (approx.)1400MHz for $60. If I place this antenna in my attic will I drastically decrease it's performance as opposed to placing it on the roof??? I live in a two story home on a hill that is above everyone else.

Thanks in advance,
lenny@pmafire.inel.gov

I must try this. I wasn't aware that it existed.

I would suspect that a discone antenna, although it might work slightly,
would not get you the best signal available. The design of the discone
is most efficient for signals low on the horizon (read as earth based
signals).

As for picking up Ham TV signals with a cable ready set... it works, but
I would like to know how you "tune between 59 and 60" being that most all
modern day TV tuners (the ones that would be cable ready) are stepped and
not variable. (What is the exact frequency for webersat?) Hopefully you
will have enough signal available so that the tuner will lock onto the
off frequency signal.

922. WEBERSAT TV SIGNALS OF EARTH

Newsgroup: rec.radio.scanner
Date: 1994-02-08 16:46:01 UTC
From: wai@iai.mv.com
Message-ID: <760725961snx@iai.mv.com>
Source record: 277230

Has anyone here tried receiving live TV images of Earth
from the WEBERSAT ham satellite using this configuration?:

440 Mhz Ant --> CABLE TV BOX TUNED BETWEEN CH 59-60 ---> Home TV

Explanation of above:
Replace cable tv signal with 440 antenna.

Cable TV Box is tuned between CH 59 and 60 to pick up the sat's tv
pictures of Earth being transmitted on the 440 ATV Ham Band.

Output of Cable TV box to TV set for viewing.

1. I would like to know what the quality of the signal is with this
configuration, if anyone has done it.
2. Can I get away with using a discone antenna or do I have to use
a hi-gain yagi?
3. Does anyone use their video-capable high-end scanner (Yasea, ICOM)
for viewing tv sat images?

Thanks

Message-ID: <e1TFHc1w165w@ftgcorp.UUCP>
Source record: 277231

For the recent poster(s) looking for a professional place near Chicago
to have your scanner modified, go to

The Command Post
6143 West Touhy Ave
Chicago, IL 60648
(312) 631-5560

It's run by Ted and Kim Moran, who also help run the Chicago
area scanner radio group. Ted is also the author (compiler?)
of the Scanner Master book for the Chicago area.

Ted sells scanner-specific supplies and books out of his store,
as well as doing scanner modifications.

I have no connection with Ted or Kim, other than having purchased
an antenna and NiCad batteries from them. They're friendly and
knowledgable folks, and after some negative experiences in some
Chicago-area ham radio stores, I highly recommend giving your
business to Ted.

Dan

Uhh... Norm, perhaps you should read the FARs/AIM a little more carefully.
From the "Pilot/Controller Glossary", quoted verbatim:

AIRCRAFT CLASSES -- For the purposes of wake turbulance separation minima, ATC classifies aircraft as Heave, Large, and Small as follows:

1. Heavy -- Aircraft capable of takeoff weights of 300,000 pounds or more whether or not they are operating at this weight during a particular phase of flight.

2. Large -- Aircraft of more than 12,500 pounds, maximum certificated takeoff weight, up to 300,000 pounds.

3. Small -- Aircraft of 12,500 pounds or less maximum certificated takeoff weight.

>bit.

I was trying to increase the "reach" of my BC55XLT by putting up an outdoor antenna so I could get a little more coverage of nearby railroad activity. I bought an omni-directional scanner antenna from a radio supplier and looked forward to better performance. However, when I connect to the outdoor antenna my radio picks up fuzzy, garbled broadcast band (like AM or FM) transmissions and dosen't pick up any of the stations that it usually does except for some police and fire service from a repeater antenna about a mile away. (It picks these up with no antenna). I believe that, from reading this net, what I am experiencing is front end overload.

I would like to knock down the signal strength so that it would work with my radio and still be an improvement over the rubber duckie inside the house. Am I correct in my theory about what the problem is? Do I have a "matching" problem requiring a antenna tuner or do I have an overload problem that could be solved by putting some extra resistance in the antenna line? (Or is it something entirely different)?

BTW, the '55 works very well with the duckie and also with the Radio Snack telescoping antenna that is frequently discussed on this net.

>1--Does a particular model, say a radio shack one, when it says
>police frequencies, are those going to be =all= the frequencies
>for police (I know other enforcement agencies have other freq's,
>but not interested in that stuff).
Depends what bands the police are on. If the police are on a 800MHz trunked system, and you get a scanner that only goes to 512 MHz, no it won't. Best bet is to see what frequencies your local departments are on, and then go from there. Chances are, if you are in a large metropolitan area, at least some of the services will be on 800MHz.
>2--More generally, are the same bands for police use in every
>state in the U.S. or can different cities use different
>bands?
The latter is correct. In Maryland, for example, the state police run on low band VHF (around 33 MHz I believe). Prince Georges County, MD police run on UHF frequencies (494 MHz). Baltimore County police are on an 800 MHz trunked system. All in the same state, but on 3 different bands.
>3--What are the bands for police, specifically?
They fall under the public safety area of the FCC charts.
Some of the more common ones are 153-156,158-159.995, and 453-453.995 MHz.
There are more though that I cannot remember specifically.
>4--I understand it is illegal to have a portable scanner used
>for listening to police broadcasts in your car, is it still
>legal to use one at home?
It is only illegal to use a scanner in an car in some areas, not all. I do not know of any areas that ban home scanner use. Not saying that there aren't any (there may be). Best bet is to check with your local police.
>5--How much do you miss when a roving scanner for police
>broadcasts, picks one where there is talking, while the
>others are going also?
A lot of variables to take into effect here. How many channels being scanned. How busy the channels are. The scan speed of your scanner. I usually scan until I hear something that may be interesting, and then just stay on that channel until I get bored.
>6--Is it illegal to tape record (using special 10 hour
>tapes, etc.) the scanner police stuff (at home, not in

>car)?
Not to my knowledge. Once again, check with your police dept. You may get some
strange looks, but oh well. Also, if so...how are they going to catch you?
Most police departments are too busy with drug dealers, murders, rapists,
and drunk drivers to care about things such as that.
What **IS** illegal...
1) Using a scanner in the commission or a crime.
2) Divulging any information received over the scanner.
(This is more of a technicality. If enforced, every traffic reporter
on the radio/TV right now would be doing time.) :-)

>thanks for any info
>David Smith

>
>Does anyone know the frequencies for the new MA State Police 800 system???
>
>Please post them for all. Also what is the status of the old 44.XX and 42.XX
>frequencies they were using???

Stuart.... most of the 800 MHz freqs being used by the MSP are in the
same grouping as the old "Met" system. There are an additional groups
of frequencies that have been added. If you have access to the the new
5th Edition of Scanner Master, you'll find the groupings. There are a
few odd freqs as well.

What I have found is that the groupings being used here in Mass. are
not the same rotation as what the guys in NJ are talking about... but I
suspect that because our system is still growing things are not set
in stone just yet.

I have one of the new MTS2000 portables and will be getting a new
mobile very soon... when I do... I'll see if I can figure out the groupings.

Right now...the old "Met" system sites are the only ones being used for
the trunking of Troop A. The Andiver site, Holt Hill, is supposed to be
the next site up for trunking. Robbins Hill in Chelmsford was supposed
to be next... but I heard something about Nabscott Hill too. I guess
we'll have to wait. I can tell you that the coverage in many places
outside of 128 is very marginal! But give it time!

Rich, All you need do is impedance match the antenna lead to your scanner. Assuming that the antenna wire is the typical 300-ohm flat wire, get a 300 to 75 ohm matching transformer at Radio Shack. It's not a perfect match for your scanner's 50 ohm input, but close enough. Most of these balun's have "F" connectors, so you'll also need to buy an "F" to "BNC" adaptor. You'll now be set. Good luck!

You want any TV capable of receiving the SAP (second audio program) channel. Most stereo TV's can do so. You'll find many PBS dramas are "audio captioned" for visually impaired persons. However, any fan of radio dramas will also enjoy listening to TV that doesn't require you to watch.

I would recommend the Channel Master 8094A. From other monitors listening experience, and a review in Monitoring Times (a few years ago) convinced me. The antenna retails for somewhere around $45. Grove Enterprises has the same antenna under their name (the Scanantenna). I have heard of Austin-Condor's antenna line but have never heard any reviews of them. They claim Federal agencies use their products, so I can imagine they are expensive! ;-)

A discone antenna, while great bandwidth, only has unity gain.

You are probably getting 10-15dB gain simply going from an
indoor dummy load (rubber duck) to something high and in the clear.

You might try to filter out some of the offending frequencies
using frequency-specific filters that you can make yourself
from tables in, for example, the ARRL handbook, or can buy
from commercial radio outfitters. (I like International
Communications Equipment, Inc. for their overdesigned boxes;
1 800 ICE COMM for a free brochure and tip sheets).

Knock down the commercial stuff below 25 Mhz and see how that works
before thinking about beam (directional) antennas or other
remedies.

Greetings......
I just stoped into Radio Shack to browse.....behold...a brand NEW
hand held scanner!!
RS PRO-51
BEAUTIFUL thing...more compact then the 43!! Scanning frequencies are as
follows:
29-29.7
29.7-50
50-54
108-136.975
137-144
144-148
148-174
406-450
450-470
470-512
806-823.9375
851-868.9375
896.1125-956

Anyone know about this scanner....can it *mod* for "800"?
I tell you...I was VERY impressed by its appearance!!

Bzzzzzt! Close but no cigar. For receivers, impedance does not need to
match. You only need to get the right connector.

OK. In the search for a handheld I've found that the Pro-43 doesn't receive 108 to 118 MHz which the RS catalog designates as "air navigation." I thought that most all the plane to ground comm occurred from 118 to about 122 MHz.

What goes on in 108 to 118 MHz? If I want to listen to the tower am I going to miss something? Also, is it correct that the air band is AM rather than FM? The RS dweeb didn't even know how to unlock the keyboard so couldn't answer any *real* questions.

Thanks,

Bob Kunz

Yes, I intend to look into this some more, but I don't hold out much hope. The government in general and the cops in particular in this country are contemptuous of the public. Their attitude is "if you need to know, we'll tell you." You should read about the kid glove treatment that 6 Montreal cops got after recently beating a man into a coma. Anyway, I'll be writing to the Police Board, the city, the province etc. etc. If nobody speaks out then they are sure to get their own way.

I don't spend a lot of time in that band, but I know there are aircraft
navigation beacons that pilots use to set their course. The only audio
part is the morse code ID for the beacon. I don't know of anything else
in that band. Normal aviation stuff is from 118-136 AM

I believe that Grove Enterprises carries a VHF-UHF notch filter. I don't remember all the bands that it attenuates, but I do know that it does filter out the Commercial FM Broadcast band (87-108 MHz). I think that's what the original poster was having problems with.

[I have no affiliation with Grove Enterprises]

Later...

Question:

This technology uses a narrower bandwidth, with minor reductions in dynamic
range right? Doesn't ACSB use some form of compression/decompression to
achieve this? I remember reading about ACSB when looking at the Extra class
test question pool...

A friend ran across these and EMail'ed 'em to me... Haven't tried them because I bought a Pro-43 instead of the Pro-46. Remember, the Pro-46 is made by Uniden I haven't heard too many good things about them...

BTW, I love my Pro-43! :)

Anyway, here are the Pro-46 mods...

--Ed

Here is what I found for the Pro-46 mod - same from 2 different sources:

Pro46.Mod
You will be able to tune continously from 80?whatever to 95?whatever
and this will include the appx 870 - 890 cellular band with the
proper 30 MHz steps for the cellular frequencies.
1.Remove battery pack, battery door and antenna.
2.Remove the 4 black screws on the back of the radio: push upward on bottom at rear case and cantliever (swing) case half up from bottom to separete and remove, its not necessary to remove belt clip.
(note: This sounds much easier than it is. Be prepared to "prop and lever" around 3 catches in the battery case, along with one on each side around 1/4 of the way down the case)
3.Carefully separate RF board from processor board by inserting eyeglass screwdriver between board by plug-in connector.
4.Unsolder copper-coated plastic Rf shield from microprocessor and set aside.
(note: If memory serves me correctly, this SHOULD be the side where the pushpad is. In order to follow the rest of the instructions, place the scanner face down on a piece of cloth or in a clamp with the antenna facing AWAY from you).
5.Locate two resistors marked "0" (zero) on right side of board.
(note: On mine they were labeled "000", not "0")
6.Carefully unsolder and remove BOTH of the resistors.
7.Reinstall ONE of the removed resistors (or jumper) on the UPPERMOST set of EMPTY solder pads.
(note: These are located just to the left of where you just removed the two resistors.)
8.Thats it, reassemble the radio.
PS-Reintstall one of the removed zero marked resistors into top set of empty solder pads. DO NOT install anything into LOWER SET of empty pads (cancels 30-

50 mhz and adds 68-88 mhz.
- -
The Following modification is intended only to restore contin-
uous 760-1300 MHz coverage as originally provided by the design
of the PRO-46 Microprocessor.
824-851, 869-896 MHz Freq Restoration :
Tools Required: Fine-tipped soldering iron, desoldering wick,
small Phillips screwdriver, small jeweler's type screwdriver,
long-nose pliers, rosin core solder.
(1) Remove the battery pack, battery door and Antenna.
(2) Remove the four black screws from the back of the radio,
then push upward on the bottom of the rear of the case,
carefully swinging it upwards and removing it.
(3) Carefully insert a small (jeweler's) screwdriver between
the two boards next to the interconnect plug in the lower
right coner. Gently pry the top board up to sparate it.
and set it aside.
(4) Unsolder the copper-coated plastic shield from the
microprocessor and set it aside. (CAUTION : Too much
heat will damage the shield).
(5) Locate the two chip jumpers imprinted with "0" ,near the
edge. carefully unsolder and remove both.
Note: they are side-by-side below the microprocessor.
(6) Solder one chip jumper across the two uppermost unsed solder
pads (Closest to microprocessor). Soldering a jumper across
the lower two pads (futhurest down from microprocessor),
changes the 30-50 Mhz low band to 68-88 Mhz for foreign
use. Note : Unused pads are allmost straigth across from
where the jumpers where originally installed.
(7) Reversse steps 1-4; the modification is now complete.

Ok I just purchased a Pro-43 from Marymac.. and it should be here Friday
or early next week (I cant wait! :>)

Heres the thing.. I need someone to send me all the Mods that they know
work for the Pro-43..

And if you have it .. Frequency lists for Iowa State University and General
Iowa / Ames area freqs..

And one more thing.. if you have it.. the Freqs for the Maryland/DC area..

Thanks alot..

tarjan@iastate.edu

I know about the Pro-43 low-band (50-88) restoration mod... I hope to do it soon.

What I'm looking for are mods to increase the coverage even further. Do you know of any? Is it even possible to do with the circuitry inside of the Pro-43?

Does anybody have the schematic of the Pro-43? Does it look like there are any possibilities?

Please respond via EMail and netnews...

Thanks,

--Ed

: As for picking up Ham TV signals with a cable ready set... it works, but
: I would like to know how you "tune between 59 and 60" being that most all
: modern day TV tuners (the ones that would be cable ready) are stepped and
: not variable. (What is the exact frequency for webersat?) Hopefully you
: will have enough signal available so that the tuner will lock onto the
: off frequency signal.

There is not any ham band there. The frequency for Ch 59 is 433.25 MHz, with
Ch 60 the normal 6 MHz higher.

Some older cable boxes had a fine tune adjustment - they are rare these
days. I suspect that any signal received that way would be due to intermod.

Al,

I got this from an old scanner magazine in the early '80s. I was never convinced it actually enabled me to scan out of band, but it did tumble the readout numbers out of band. Here are the keystrokes so you can decide for yourself:

Manual
49
Limit
50
Limit
Search
Hold
Manual
406
Limit
405
Limit (reads "Error"--ignore this)
Search

theoretically, your warranty is void if you modify the scanner,
so you can't do anything if they refuse. but, do you really want
to wait till the warranty is over before you do the mods ? ;^)

> MHz.

Police frequencies are mainly licensed in the Police Radio Service, with
some PDs also having access to Local Government Radio Service frex.

> aren't any (there may be). Best bet is to check with your local
> police.

No it isn't. Local police officers are generally a poor source of
information about the legalities of anything that they don't actually deal
with every day. Many officers have the opinion that police scanning should be
illegal. Some municipalities have ordinances against mobile or portable
scanning and the officers may not even be aware that the laws exist.

>>6--Is it illegal to tape record (using special 10 hour
>>tapes, etc.) the scanner police stuff (at home, not in
>>car)?
> Not to my knowledge. Once again, check with your police dept. You may

> you?

You may also get some wrong answers.

> What **IS** illegal...
> 1) Using a scanner in the commission or a crime.
> 2) Divulging any information received over the scanner.
(This is more of a technicality. If enforced, every traffic reporter
on the radio/TV right now would be doing time.) :-)

Stick with the facts. The general consensus seems to be that what the
news media do with information intercepted by scanner is protected by the
First Amendment. They have the money to protect those "rights".

Other illegal activities -

3) Monitoring mobile telephones, one-way paging, studio-transmitter links, broadcast remotes and certain other services.
4) Monitoring cordless phones in California, Oregon and New York.
5) Unscrambling encrypted communications.

>open the case and let me look at it (some nervous newbie) and they didn't have
>any info on it (they wouldn't let me see the manual either.
>
>Anybody have any info on this scanner?

I work at RS also (sorry about the guy not wanting to pull it out
but we loose lots of them, and like most companies RS ussually suspects
the employee first.) Actually the new 51 looks like the replacement for
the Pro 39. Frequency coverage varies only a few MHz from band to band,
same price as the 39 ($299.99) but most of all it's still a dual conversion
rather than a triple conversion like the Pro 43. Hope this helps.

This is wrong, unless the band has been removed since 1983. 433 MHz is in the middle of one of the UHF Ham bands.

I think you're talking about the discone antenna. I have it in my attic.
The roof is wood plywood with fiberglass shingles. You might have a problem
if its metal covered.

My antenna works fine with my 2006. I don't know how the wood affects
the antenna above 1 Ghz. I've also used it with my ham rig to contact
the Mir space station (150 miles up) several times.

For those of us in the U.S. who purchased a cellular capable MVT-7100 from Javiation I have good news! I e-mailed Jonathan Clough concerning repair work in the MVT-7100 after the April 26th cut-off date for the importation of cellular-capable scanners. Here's the reply I received:

- - - - - - - - - -
From: "Jonathan Clough (U.K.)" <100117.535@compuserve.com>
To: Jason White <jdwhite@iastate.edu>
Subject: Re: Future repair of MVT-7100

Hi Jason,

Thanks for the mail last week, and I am sorry for the delay in getting back to you.

After April 26th it will technically be illegal for you as an individual to import cellular capable scanners into the US but if you have something to go out for repair and both you and us provide documentation that you originaly imported the radio before April 26th 1994 their should be no trouble.

I am currently in touch with the FCC and this seems to be the case.

Hope thats helps, but if you have any problems give me a shout.

Cheers

On the handout that was being passed around at the club meeting
I saw WO-18 437?Mhz AM NTSC Video.

Anyway here is the repsonse from a WEBERSAT user:
"

Wai,

Sorry, no video from WO-19. The images are digitized NTSC waveforms from
a heavily modified (for space) Canon Ci-10 color TV camera. The downlink
format has been published in a number of places. Webersat was one of the

original 4 microsats and we didn't configure it to downlink pics in gif form, though we may get around to that someday.

Though first generation microsat technology, the pics compare favorably still with those coming down from some of the newer amateur radio imaging spacecraft. I believe they are still the only color pics coming down from ham birds. I could be out of date on that.

We here at Weber are making a modest contribution to the Phase 3d effort and are deeply involved in a joint project with the Air Force Academy to launch a 3 axis stabilized, very low thrust propelled spacecraft in the fall of 1995. There will be extensive ham payloads aboard. SO So you see we are trying to remain players in the amateur radio/space world.

Cross-posted to:
rec.radio.shortwave,rec.radio.amateur.misc,rec.radio.scanner,rec.video.satellite,rec.radio.cb,alt.radio.scanner,alt.radio.pirate

This week's Spectrum will feature a listener appreciation and input segment. It will be your opportunity to give us feedback. What you like, what you don't like and or what you would change if you were in the Spectrum drivers seat. In addition we'll have lots of the features you enjoy.
--
Spectrum airs live Sunday at 0300 UTC (2200 EST Saturday) on:

WWCR, 5810 KHz, Nashville, TN (World Wide)
WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
Omega Radio Network, Galaxy III, X17, 5.8 MHz WIDE audio. (Satellite)

Spectrum is rebroadcast:

Sunday at 1500 EST, on WIFI, 1460 AM, Philadelphia, PA (Philadelphia Area)
Monday at 0400 UTC (2300 EST Sunday),
on WWCR, 7435 KHz, Nashville, TN (World Wide)

WANTED WANTED WANTED

Looking for a used AR 3000 A in good condition. If you want an offer or have one in mind, feel free to call & leave me a message at (703) 816-7823.

973. Wanted: Ar1000xlt

Newsgroup: rec.radio.scanner
Date: 1994-02-10 17:28:00 UTC
From: Scott.Snyder@f239.n109.z1.fidonet.org
Message-ID: <140_9402101407@blkcat.fidonet.org>
Source record: 277081

Bob, I have an AR 1000 xlt in great condition. No Scratches. In fact, tuned up last year by ACE under warranty. I have a Radio Shack scoping antenna that works much better than the stock, so I'll throw that in. Also, Howard Bornstein's Guide to the AR 1000 xlt is included, seeing how the stock instructions are so lousy!. Call me and leave a message if you're still interested.

(703) 816-7823. Voice Mail. I'll call back.

Sorry Bill, but the ham band runs from 420mhz to 450 mhz. Many blocks
of frequencies in this segment are restricted near international borders and
near radio-telescope installations, but for the most part, in the US, it is
the ham band.

>
>Some older cable boxes had a fine tune adjustment - they are rare these

FWIW, In Contra Costa County CA, atop Mt Diablo there exists an ATV repeater
that is on 427.25. It is receivable on any Cable ready set on Chn 58 via
a UHF Yagi aimed at the top of Mt Diablo. When the ATV repeater was
first installed, the frequency was on 428.25 but due to the flexability of
the frequency 1mhz down, it was re-crystalled. Reception WAS possible on
a CATV set when it was at the 428 mhz frequency, but it was not as good as
it is now that it is on-frequency for cable ready sets.

Now I'm confused. (Aughh... it's your fault Bill ;-)) What are you saying. (that's what I'm confused about)

WeberSat, I assume (haven't heard about it except for here) is a HAM experimental satelite.

Cable Frequencies ARE in the middle of Ham bands, Aeronatical Bands, Public Safety bands and commercial bands. As long as they keep their signal inside the cable, no problem.

CATV 18 is in the 2mtr band
CATV 19 is in the public safety VHV-hi band
etc etc etc

CATV 59 is NOT UHF 59.

Being that ATV follows the standard US commercial NTSC television standard, it is a mixed blessing that CATV uses ham frequencies... It makes ATV reception readily available to anyone with a CATV ready set and a UHF antenna. This can be a great help in time of disaster when the ATV system is used for disaster gathering. In Contra Costa County, most of the EOC's are equiped to receive video from the ATV repeater atop Mt. Diablo. There is at least one helicopter (CA Forestry i believe) and possibly more which have the wiring built in and ready for an Amateur ATV operator to plug in his/her equipment for immediate Air surveying of an incident.

977. new MASS SP Freqs Info

Newsgroup: rec.radio.scanner
Date: 1994-02-10 19:04:50 UTC
From: slitel@cadre.com
Message-ID: <1994Feb10.190450.8357@fripp.ri.cadre.com>
Source record: 277085

Yes I was finally able to get a copy of the new Scanner Master 5th Edition
for Massachusetts....

Here is what I found for the Mass State Police...

Troop A - 858.2375 (temporary it states)
Troop B - 42.46
Troop C - 42.40
Troop D - 42.50
Turnpike - 159.030
Repeater 154.92
Statewide Emergency 42.44
Tpke. Car to Car 44.90

Then it went in to this long discussion (which I understand less then 10 words)
about the new 800 Mhz system.. This system they are putting into place
and then it listed the 800 band trunking channels.. I will put these up, but
what are these trunking channels in simple english??? Also if you
wanted to effectively listen to the Mass S.P. - should you listen and
monitor all these channels???

Here they are (sorry they are not in order)

856.7375
858.9825
856.9875
857.7125
857.7375
857.9825
857.9875
858.7125
858.7375
858.9625
858.9875
859.7125
859.7375
859.9625
859.9875
860.7125
860.7375
860.9625
860.9875
857.2125
858.2125
859.2375
859.4625

860.2125
860.2375
860.4625

Now for a few others that I finally found... The traffic reports...

Metro Traffic 450.2125
Metro Traffic 455.1125
Skyview Traffic 450.1125 (Book also lists as Metro Traffic too)
Smart Routes 481.300
Smart Routes 466.300 (Repeater)
WBZ Traffic 450.65
WHDH Traffic 450.5875
WROR Traffic 455.35
WHDH/WCOZ Traffic 450.150

A few last notes..
1) The book also lists a few other Mass State Police Misc channels such as:
39.80
39.02
39.12
858.7125
42.38
39.76
42.42
42.54 (RADAR TEAMS!!)

2) The book itself - This book is the biggest collection I have ever seen. It lists everything you could think of from the State Police onto every know Mass. Frequency held by anyone.... The book cost me $29.95 at U-Do-It Electonics in Needham (I know you can get it mail order)

I do ask that you do not go and request frequencies from me on all the cities and towns out there. Go out and get the book if you are that serious. I posted these since they are the most requested and would be of interest to all in Massachusetts. I found the traffic frequencies very nice since I have a portable scanner and I always like to know what the traffic situation is while I am on the road. As for your local city and town - they also have a small handbook that just lists channels of major interest, all cities and towns and state stuff for $13.95.

PLEASE DO NOT GO AND NOW SEND ME MAIL ASKING ME FOR A SPECIFIC FREQUENCY OF SOME PLACE IN MASS!!

>108 to 118 MHz which the RS catalog designates as "air navigation." I thought
>that most all the plane to ground comm occurred from 118 to about 122 MHz.

Its been a long time since I've flown, but as I remember it the navaids tended
toward the lower part of the band while the voice communications were placed
in the upper half. So if you want to listen to your local VOR the PRO-43
won't do the trick :-)

>What goes on in 108 to 118 MHz? If I want to listen to the tower am I going
>to miss something? Also, is it correct that the air band is AM rather than
>FM? The RS dweeb didn't even know how to unlock the keyboard so couldn't
>answer any *real* questions.

Again its been 15 years but everything I used was AM.

> opposed to placing it on the roof???

It wiall almost certainly work less well in the attic than it would on the roof. The roof is full of roofing nails, maybe some metal furnace ductwork, maybe some metal pipes, etc.

But the same is true of the rest of the house. Putting any sort of decent scanner antenna in the attic will give much better results than the scanner's built-in antenna.

Try the attic installation first, and move up when you're ready for more.

The aviation frequencies use AM. The reasons for this are primarily historical, although one can make technical arguments for its merit.

VOR navigation provides angular information (magnetic bearing) of the position of the VOR station to the pilot, independent of the orientation (heading) of the aircraft. It's a complex system that uses relative phase between two transmitted signals to represent azimuth with respect to the station.

While not frequent, voice communications do occur on the navigation frequencies. Flight Service Stations can transmit voice information to a pilot through a VOR facility. This is done in a half-duplex mode, where the pilot transmits to a particular frequency in the COM (voice) part of the aviation band (usually 122.1 MHz), and identifies the navaid (VOR) station that's being used in the plane. The FSS responsible for that navaid will

then transmit voice on the navaid frequency. Most aircraft have two NAV/COM units installed, making it possible for the pilot to transmit on a COM frequency while listening to the COM frequency. Also, many VOR transmitters use voice identification in addition to Morse code.

sdsst4+@pitt.edu (Scott D Schneider) writes:
: Where can I get information on modifying the BC200XLT to pickup the
: Cellular band?

You cannot receive the band properly - the BC200 (like most Bearcats)
scans the band in 12.5 MHz steps. This does not match up with the cellular
30 MHz spacing, so you will not receive some of the channels, and others
will be weak/distorted.

Is it possible to modify the radio shack pro-2023 to receive frequencies above 800 Mhz?

990. Re: Pro-2030 mod?

It's probably bad form to reply to oneself.

I found the mod on AOL; Charles Copeland also emailed the mod to me.

Modification to restore cellular frequencies in the Radio Shack
PRO-2030
Scanner.

This mod is essentially the same as the PRO2026 except the location of
the
jumper is slightly different.

1. Remove power cable.
2. Turn unit upside down.
3. Remove five (5) recessed screws from bottom panel.
4. Carefully remove bottom panel.
5. With display panel facing you, locate the jumper marked L201 on
the
circuit board attached to the display. It will be about
2" in from the from and 2" in from the right side. It will look
like a RF coil.
6. Cut the jumper marked L201.
7. Reinstall the bottom and reconnect power. Scanner is ready for
use.
8. Cellular frequencies are now restored with 30 Khz channel spacing.

Please note: I picked up this mod from the FIDO net. I have never
completed the mod myself because I own the 2006. But I do have the
service manual and this is the diode that locks out the cellular band.

Even the specs show this diode connected to pin 10 of the
microprocessor.
This pin is the STRAP OPTION CELLULAR SKIP. Too easy!

It's 30 KHz, not MHz.

The new PRO-51 portable scanner, a replacement for the GRE-made PRO-39,
has a Service Search feature for several services including
Fire, Weather, Air, and Marine.

From the frequency coverage and other features, my first
guess is that the PRO-51 is made for Tandy by Uniden.

The rounded case is wider at the top and more narrow at the bottom,
like a hamster squeezed in a tight grip. Too bad it's larger than
the PRO-39/PRO-43.

Remove power source from BC100XLT, and turn on for more than 30mins
and that most certainly will clear the scanner of memory...or just
reprogram the channels...

Thanks for your insight David. Too bad it's wrong when you cross the border.
The original poster was posting from the freenet in Ottawa, Ontario, Canada.
Points 1 & 2 are the only laws in *Canada* that apply to scanners and radios
in general. Your added points (3,4 and 5) do not apply up here. Remember
that Usenet is worldwide and your laws might not apply.

I could be wrong, since this thread is a little hard to understand, but
this is CABLE we are talking about not RF. I couldn't find my chart but
it is not unresonable that 433MHz is ch 59 on cable. So you hook an antenna
to the box and get 70cm ATV. I have heard of this before. In fact, you
can do it without a cable box by setting your cable-ready TV to the cable
setting and tune in to CH 59 or 60 using your roof antenna.

GAAAAAAAACK. Yet another scanner that apparently can't
listen to the military aviation bands. Some of us really don't
WANT to listen to cellular (although we continue to fight for
repeal of stupid laws......) and would really like to get a
decently priced rig for those 200 and 300 MHz frequencies......

The features are great but I would not reccomend this scanner to anyone
in a city with high RF levels unless you plan to use the CTCSS optional
module. If you have intermod problems with other scanners, this will
probably not meet your needs.

It was not manufactured cellular capable though. Are you saying it receives cellular. If so, it has been modified.

> LIKE BRAND NEW WITH MANUAL!!! WILL SELL
> FOR $200 + SHIPPING /........

The Pro37 is a pretty nice scanner. I have the earlier almost identical Pro34. I got mine brand new for $229 years ago. $200 is a very steep price for the Pro37. I'd be hesitant to give $150 for it, especially if it has been opened up and modified. But, that's my opinion. If you can find some poor sucker to pay that price, you're lucky.

From: derek.buchler@channel1.com
Message-ID: <40.867.2433.0NE17043@channel1.com>
Source record: 277112

Does anyone have any additional information regard the new "No-Antenna" for scanners and shortwave radios being offered by Grove Enterprises? This device is being advertised as a solution for those that don't want to mount an antenna on their vehicle. I don't think that they are referring to the "splitter" that can be used with the car's original antenna since it was also mentioned that it is suitable for use in hotel rooms.

I'd be interested in hearing from people that have tried this device.

I don't have much time, but here's the manual entry on the AUTO key:

AUTO KEY
Use [AUTO] toutomatically store active frequencies into open (empty)
channels of specified banks. To use Auto Store, first set the
upper and lower limits of the band to be searched.

In Search Mode, press [AUTO] to activate the Auto Store feature.

Press the numeric key(s) for the bank(s) to store the frequencies.
("AUTO" appears on the display when Auto Store is activated.)

To stop Auto Store, press [HLD], [MANUAL], or [AUTO].

: I have compared it to all my scanners and the handset
: takes the cake.

I don't know, but my old pro-38 with the $10 whip is a hell of a lot more sensitive than my at&t's handset! I have a hard time believing that the puny antennas that come on most handsets would do that well, especially from inside a car. My wife's Festiva is set up to use the radio antenna for the scanner, and even THAT is more sensitive than the rubber duckies (which suck on VHF-lo anyway). Methinks you should have gone with a better scanner antenna instead of a phone, but hey, if it works for you then I guess it's okay.

Happy investigating!

1011. Freq allocations file FTP-able at ftp.catt.nscu.edu or not?

Newsgroup: rec.radio.scanner
Date: 1994-02-11 23:25:39 UTC
From: slush@voa.gov
Message-ID: <CL32Es.A68@VOA.GOV>
Source record: 277119

Late last year, a poster notified this newsgroup that he had massaged the 1993 Grove database of FCC allocations for Illinois, and came up with 3800 lines of data which was pretty much an allocations table of frequencies.

He said he had made it available for FTP at garfield.catt.ncsu.edu (recently changed to ftp.catt.ncsu.edu), as "BandPlan_Grove1993" in /pub/alt.radio.scanner/FREQS.

I've found /pub/ham-radio/scanner/FREQS at that site, but no such file (there is a smaller allocations file, but it's only 200 lines or so and a number of them seem to be incorrect). An archie search for "grove" or "bandplan" didn't have any success, either.

Can anybody in Netland supply a better site to access such a file of allocations?

Thanks in advance!

Joe (slush@voa.gov) Standard Disclaimer blah, blah, blah.

1012. New, higher power speaker mod for the Pro-43

Newsgroup: rec.radio.scanner
Date: 1994-02-11 23:29:33 UTC
From: steve@galaxy.nsc.com
Message-ID: <CL32LA.G9r@voder.nsc.com>
Source record: 277120

I called the Radio Shack parts center (817) 870 5600 to ask for the price of a replacement speaker. I was surprised to be told by the individual that some of the Pro-43's had a 200mW speaker installed and that there was just in the last two weeks a new 500mW speaker replacement available through them for $11! The service manual is $6 and delivery of all is very inexpensive ~$2. The 200mW speaker has a part number on it as #123 and the 500mW speaker has a part # 127.
The power saver function, only actived in the manual mode, reduces power use by 75% after about 5 seconds of no reception. 85mA for 270mS, 5mA for 1 second, 1.3 second period.
I just checked my very recently purchased pro-43 and it has the 200mW speaker! The speaker mod, although I have not performed it yet, is convenient to do during any other suggested mod which a person might be inclined to performThe speaker is glued in and under the keypad entry board.

I've been told by reliable sources scanners at Radio Shack are made
by both Uniden and GRE...Uniden makes the lower priced scanners and GRE
makes the higher priced (like the 2006 and Pro 43).

Thnaks for this information, but most of the people reading this newsgroup
have known this information for years and years.

By the way, the PRO-51 is priced at $299 and is made by Uniden ... does
that break your price rule?

This is true however I have put the radio on the bench and it is very sensitive in the cellular range, also not that some channels will still be readable. If anyone needs the mod, let me know. I have it here.
Regards.

The full 70cm ham band runs from 430 to 450 MHz. Portions of that band
are restricted near the US-Canadian border. The nationwide common ATV video
frequency is 439.250 MHz.

2778 5900 72 19% 61 212.1 65% 0.01 0.1% aus.radio

Several positive trends continue this month. Readership is up dramatically in all active newsgroups (closely following Usenet's predicted exponential growth patterns). Previously tied, rec.radio.amateur.misc has surged ahead of rec.radio.shortwave, which is running second this month. Other newsgroups with extremely strong showings are rec.radio.swap and rec.radio.amateur.policy (meeting their respective goals of keeping for-sale messages and extended legal debate out of the main discussion newsgroup). Currently, rec.radio.amateur.homebrew leads the other new rec.radio.amateur newsgroups by a slight margin, although all are roughly at the same order of magnitude. The recently-created rec.radio.scanner is slowly gaining in readership as well, its propagation almost tied with alt.radio.scanner, which it supersedes. Recently, Chris Yoder (chris@tali.hsc.colorado.edu) sent out an rmgroup for alt.radio.scanner. Unfortunately, a user at another site (infamous for doing these things) took Chris's rmgroup message, converted it to a newgroup message, and sent it back out. Because of this, alt.radio.scanner will not be deleted at sites that obey control messages automatically. Be advised that the newgroup message is a forgery and only the rmgroup message should be carried out.

It is expected that the newly-created newsgroups will continue to grow in readership like previously-created newsgroups such as rec.radio.info and settle out at about 60-70% propagation. If these new radio-related newsgroups still haven't reached your site, please ask your news administrator to create them (refer him/her to the new newsgroup announcements by Dave Lawrence in news.announce.newgroups or the messages posted to the new newsgroups piling up in "junk" :-). Especially point out to him/her that cost/per-reader/per-month is significantly down in all newsgroups.

The defunct newsgroup rec.radio.amateur.packet has been rmgrouped as of September 21st, 1993, and is no longer connected to the PACKET-RADIO mailing list. Netters interested in packet-radio discussion should use rec.radio.amateur.digital.misc and the HAM-DIGITAL mailing list. Propagation and readership continues to drop in the old newsgroup, which is currently in last place among all the rec.radio newsgroups. If this newsgroup still appears at your site, ask your news administrator to rmgroup it.

Note also that the defunct rec.ham-radio hierarchy reappears this month. If the newsgroups are still active at your site, please try to persuade your your news administrators to delete them as these groups have been rendered obsolete (for over 3 years now) by the rec.radio.amateur hierarchy.

>local (or national) basis. For example, A become Able, B = Baker, etc...

Just to elaborate a bit:

The sequence starting with Alpha Bravo is called the International Phonetic Alphabet. It was introduced (in the 1950s, I believe) as a replacement for the sequence starting with Able Baker, which was in widespread use in the U.S. before that time.

The problem with Able Baker is that it is not particularly mnemonic in languages other than English. For example, a French speaker who doesn't know any English might hear "Able" and think that it logically begins with E. The new standard was an attempt to solve this problem, by using words whose phonetic spelling is similar in most European languages.

There are other phonetic alphabets, whose origin I don't know. Around here, the police use an alphabet beginning with Adam Boy.

>answer any *real* questions.

Bob -- The 108-118 MHz band is mainly navigation aids, so you won't be missing anything you want to hear. You're correct that aviation is almost entirely AM (I guess the air mobile telephones are FM, however).

I just got a Pro-43 a week or so ago, and have been very pleased with it. The only complaint I've got is that it goes through batteries as fast as my 2 meter HT transceiver -- maybe faster than the 2 meter rig does on one watt. If you are familiar with battery life in ANY other radio receiver, you'll be amazed.

What's nice is that they have a connection so that you can charge a NiCad battery while the scanner is one. (That should have been "the NiCad batteries" since there are several of them.) Buy an AC adaptor and leave it plugged in, but don't plan on spending a lot of time operating the scanner off of batteries.

: type of club is it.

Unless they have done some great things lately, the computer program is a JOKE! The information was years old and NOT accurate. There were typos throughout it and the program, itself never worked correctly. If the club is in the same calibre, buy a book, and not Betty Bearcat. There is no way to keep up to the day info on freqs, unless you are in business of doing so, but now book or disk should be more that a year behind in both freq and accurate information.

I just got mine last week. I got close to 30 hours on the first set of
Energizers and over 20 on the second set before replacing them with nicads
(they were still going, and going... :-). I'm not too familiar with radio
receiver battery life, but is this bad?

>What's nice is that they have a connection so that you can charge a NiCad
>battery while the scanner is one. (That should have been "the NiCad batteries"

>but don't plan on spending a lot of time operating the scanner off of batteries.

I put RS's 850ma/hr nicad's in a couple of days ago and got around 7-8 hours
after an initial charge of about 14 hours (I really wasn't counting).
Unlike the alkalines which go for quite some time after the display starts
flashing with the warning beep, the nicads go within a minute or so... not
much warning, but that's pretty much typical of nicad discharge. I got the
AC adapter/charger as well as the DC plug for the truck, so it's pretty easy
to keep the nicads charged up, but I do intend to let them discharge fully on
a regular basis. I suspect battery life (and charge time while listening)
depends A LOT on how often and long it breaks squelch and how loud you have
it turned up.

I really like the option of using easily obtained alkaline's as a backup
instead of being stuck with some proprietary nicad pack. And I'm happy
with the other properties of the PRO-43 so far.

I thought the whole ham band runs from 420-450mhz with some restrictions on the 420-430mhz portion near the Canadian border.

I'm not sure why they'd restrict anything above 430mhz since we don't have any commercial systems in there. Our commercial users have space between 420 and 430mhz only.

1032. new questions (or perhaps old news) about batteries...

Newsgroup: rec.radio.scanner
Date: 1994-02-13 20:34:35 UTC
From: surreal@u.washington.edu
Message-ID: <2jm2sr$emn@news.u.washington.edu>
Source record: 277140
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Recently I've bought a Pro-43, a bunch of alkeline batteries,
six eveready rechargable batteries, and a 9v 300mA adapter.
Funny how a scanner on sale quickly jumps to $350 with the
"options"
Anyway, after changing and charging and changing and charging,
a couple questions came to mind:

What's the trick to getting the most out of nic-cad rechargable
batteries?

Has anyone tried/had experience with the "new" RENEWAL alkeline
rechargable batteries? Is it worth the extra $$?

I've also seen a gizmo at Price/Costco that "claims" to recharge
regular-joe alkeline batteries like Energizers, Duracell, etc...
I don't remember the brand name. has anyone tried this route?
Is it the same thing as the RENEWAL, under a different cover?
I don't know about you, but I have terrible childhood memories
of opening the battery compartment of my favorite toys, only to find
leaking batteries. I can't bring myself to insert recharged
alkeline batteries in my new toys.

I just bought a Pro-43 and am very pleased also. Just wondering, how long
is the battery life for NiCad's vs. Alakine? I just bought some NiCads
today and they're charging up right now. It sounds like I made the right
decision.

>>What goes on in 108 to 118 MHz?

>Bob -- The 108-118 MHz band is mainly navigation aids, so you won't be missing
>anything you want to hear.

However, I did enjoy listening to a VOR beacon from an airport around the corner when I wanted up to date weather. It sure beat NOAA's "the next scheduled update will be at 5 p.m." when it's noontime and television's at 6:45am and 5:37pm and better hope you don't miss it. The weather channel is okay, if you a) have cable and b) can wait until they do your part of the country.

I assume it's through all VOR's, but VOR's (VHF Omnidirectional Range) as far as I understand (read books of a good friend as he spent four years at Embry-Riddle) broadcast audio signals in a special format that equipment onboard planes can analyze and tell you which way you are going and how fast. There's more to it than just radials and dme. You hear the output of FSS's, flight service stations that talk to pilots about flight plans and assistance. If you listen to FSS input frequencies (true pilots, please help) you can hear what VORs the pilot is listening to the FSS output. Listen for "I'm listening through [fill in the blank]." Your best bet is to go to a small airport and get a sectional map. You'll see the names of the VORs as well as the frequencies they broadcast on.

There's a lot more detail of course, I'm just saying (without flaming), that after someone told me I would find VORs boring, I found I enjoyed them.

Please note that they have near-zero propagation at ground level, espeically with mountains and valleys, so you need to be VERY close to the towers to hear them. At least I did with my Pro-34 and stock duckie.

Steve

Hi everyone,
Since this is my first post after several weeks of reading,
let me start by thanking everyone out there for all the
valuable information.

Right now I'm looking for information on how to get rid of
that annoying "beep" on my Pro-43 scanner. Can anyone either direct
me to the directions to this mod or post it here.
Thanks in advance.

Steve,I,and most everyone I know with a 43 gets approx.6-7 hours on a set of Nicads(std capacity)searching 800mhz exclusively.The life is longer if you are on 500mhz and lower.I get about 25-30 hours of intermittent use on alkalines with the volume fairly loud.BTW,if you buy extra batt clips,make sure there is 100% continuity beween the cells,I had one and I've heard of a couple of other people having problems with bad connections.If you have a pack that gets pretty warm,you probably have this problem.It will drop the voltage down at the terminals on the pack by about 1.0-1.5 volts and get hot after a few minutes use.I found mine by accident.I marked the batts to keep the sets straight and one day I was running the 43,and after a few minutes I took out the pack to see whitch ones were in it and the pack was hot!After checking things out,I finally figured out the clip was not right.A little crimping and that cured it.I only use this pack with NICADS,so if it goes bad again,I wont waste alkalines(besides,they really got it hot quick!).You did make the right choice buying a 43.

:
: It's 30 KHz, not MHz.

Yeah, that was a typo.

Also, the posting is not accurate in another way. If the signals are strong,
then the Bearcat should receive cellular fine. The problems will only occur
with weak signals.

1048. Your Diode Ant. Switch

Newsgroup: rec.radio.scanner
Date: 1994-02-14 15:04:00 UTC
From: Brad.White@f239.n109.z1.fidonet.org
Message-ID: <19e_9402141254@blkcat.fidonet.org>
Source record: 277155

Bill,

I've got a question for you relating to your antenna diode switch which you detailed in the V2N10 issue of WSR. My question also relates to your discussion of multiple antenna switching in the Pro-2004/5/6 in the second volume of your book.

I want to experiment with internally installing the switch you outlined in WSR in my 2004 and let the scanner automatically switch the antennas. Since the application of +5VDC is the key to switching antenna inputs, I would like to know if there is any reason I cannot take that 5VDC from the collector of Q501 - Q507 (depending of course on the frequency range of interest).

My main question is whether the current draw of the antenna switch is high enough to have an adverse affect on the operation of the scanner? If so, I'll have to use one of your switching circuits.

My second question is whether you perceive any other problems which may preclude this setup from operating properly?

Thanks for the help!

Brad

Subject: Bearcat/Uniden 700A Mods
From: N8CDX@WB8ZPN.#SEMI.MI.USA.NA

CELLULAR RESTORATION:

1. Remove the screws holding the case halves; separate them using
care to unplug the speaker lead.

2. Turn the scanner upside-down with the face away from you.

3. Remove the two side screws holding the faceplate; tilt it
forward.

4. Find the transparent cable. Using a jewelers screwdriver;
CAREFULLY pry up and unplug the cable so that the faceplat can
be tilted fully forward.

5. Locate the copper/plastic shield under the faceplate; unsolder
and remove it.

6. Remove the resistor marked "472"

7. This complete the modification. Plug the cable back in place
and test the scanner by entering 870.000 (channel spacing will
be 12.5 kHz; not 30 kHz.

8. Reassemble the scanner.

Note: I have not verified this modification. Proceed at your own
risk.

Review of the SUPER CHARGER Alkaline battery re-charger

You may have seen the info-mercial on TV staring Dick Clarke, which advertises a product called Super Charger, by Buddy L. It claims that this charger will recharge ordinary, alkaline batteries, such as Eveready, Duracell etc. The product is not related to Rayovac's new rechargeable alkaline system.

I ordered the portable model 8001 in early July, and it arrived in late October. I have heard much debate over whether alkaline chemistry can be recharged, and I was very skeptical about this

product. It cost around $40.

Construction:
The device is made in China. It appears to be fairly well made. It has a switch on the side to select either Alkaline or NiCad charging. I opened the unit up and found a 28-pin custom IC, that bears the name of Buddy L. There are some other common passive components and 4 transistors. There are 4 LEDs on the unit to tell you when each battery is finished charging ON = charging, SLOW BLINK = done FAST BLINK = battery can't be recharged

The charging scheme seems to be constant current at 14 mA. No AC component was observed on the DC output.

HOW DOES IT WORK?
TEST #1
My first test was to take some slightly used AA Energizer batteries with a starting no-load voltage of 1.4v. I put these in a 2-cell flashlight and ran it for 1 hour. The resting no-load voltage was now 1.23v. I put them in the charger and charged them up. One of cells stoped charging after 30 minutes, while the other took over an hour. The final no-load voltage of the 2 "recharged" cells was 1.27v for one of the cells and 1.33v for the other. Recharging the cells a second time did not raise the voltage any. In fact, it caused one of the cells to drop in voltage. The manual says that 1 hour in a flashlight is a pretty heavy drain, but the batteries could last "0 to 2 times longer". So maybe my test was too tough for the charger. I think the increased voltage after the charge may be no more than the natural recovery process of the batteries.

TEST #2
I took 2 AA Energizer Alkaline batteries with an initial voltage of 1.59 v. each, and placed them in my Sony portable CD player. The manual states that the batteries should last 5-8 times as long if I recharge them after each 1 hour of use. After 1 hour in the CD player they each measured 1.39v. I also put another set of batteries in the CD player and ran them for 1 hour. This second set is my control set. Instead of recharging the control set, I just let them recover on their own, for the same time as the other cells took to recharge. I repeated this process until the batteries were dead.

(all batteries were from same mfg. lot)

(recharge) (self-recovery)
Super Charger set Control Set
Fresh Batteries . . . . . 1.59 v. 1.59 v.
After 1 Hr. in CD player. . . . 1.39 v. 1.37 v.
Recharge/self-recovery (55 min) 1.44 v. 1.43 v.
Second hour in CD player. . . . 1.30 v. 1.30 v.
Recharge/self-recovery (200min) 1.44 v. 1.40 v.
Third hour in CD player . . . . 1.27 v. 1.25 v.
Recharge/self-recovery.(20 min) 1.33 v. 1.33 v.

Fourth hour in CD player. . . . 1.26 v. 1.26 v.
Recharge/self-recovery.(120min) 1.35 v. 1.34 v.
Fifth hour in CD player . . . . 1.21 v. 1.18 v.
Recharge/self-recovery.(125min) 1.33 v. 1.31 v.
Sixth hour in CD player . . . . 25 min (died) 14 min (died)
Recharge/self-recovery.(120min) 1.30 v. 1.29 v.
last run in CD player . . . . . 8 min (died) 6 min (died)

THE BOTTOM LINE
Send it back! As you can see, the charger made no real difference in how long the batteries lasted. Alkaline batteries normally go up in voltage slightly when they are taken out of use (load removed). It seems that this Super Charger does nothing that the batteries won't do by themselves. Battery operated devices are normally used for portable applications. If you follow the manual, you would need to remove the batteries every few hours (or every 15 minutes for some devices) and recharge them! The inconveniance of this makes using the Super Charger a real waste of time (not to mention trying to keep track of how long you run each battery operated device). I did not test this for Nicads. $40 for a NiCad charger is a bit steep.

Please distribute to expose this fraud

Brett Miller N7OLQ @ N6LDL.#NOCAL.CA.USA.NA

I wrote this review a while ago. I would be interested to find out if anyone has conducted similar controlled tests with this device. Since I only had one unit, I can't totally rule out the possibility of a bad unit.

Sorry about all the ^M characters. When I go from DOS to UNIX funny things can happen.

1052. Pro-2030 mods?

Newsgroup: rec.radio.scanner
Date: 1994-02-14 16:05:30 UTC
From: wolit@cbnewsm.cb.att.com
Message-ID: <CL821F.8L6@cbnewsm.cb.att.com>
Source record: 277159

I would appreciate any information on modifications to the
Radio Shack Pro-2030 scanner for reception of cellular phone bands.

Pardon me if this has been posted before, but I was unable to find an
FAQ for this group. Is there an archive site on the Net?

I heard that they were going to re-start publication sometime soon -
and that some kink of reorganization has taken place. I enjoyed the
issues most of the time and look forward to it's return.

Well, I don't know for sure what happened to them, but I subscribed for
several years and enjoyed the publication very much. I noticed that each
issue would be thinner than the last. They didn't have to many regular
advertisers either. Without circulation numbers, advertisers don't
advertise. My guess is that they may have thrown in the towel. Anyone
know for sure?

I've had good luck with a 3 foot piece of wire and an alligator clip on the
antenna of my Bearcat 800XLT to help my cordless reception. Just clip it
to the top of the antenna! For scanners that have rubber duckies - get a
second telescopic antenna (6 sections or so) and use this fully extended.

1063. Introduction to Blacknet

Newsgroup: rec.radio.scanner
Date: 1994-02-15 01:22:31 UTC
From: nowhere@bsu-cs.bsu.edu
Message-ID: <9402151122.AA00700@bsu-cs.bsu.edu>
Source record: 277171

Introduction to BlackNet

Your name has come to our attention. We have reason to believe you may be interested in the products and services our new organization, BlackNet, has to offer.

BlackNet is in the business of buying, selling, trading, and otherwise dealing with *information* in all its many forms.

We buy and sell information using public key cryptosystems with essentially perfect security for our customers. Unless you tell us who you are (please don't!) or inadvertently reveal information which provides clues, we have no way of identifying you, nor you us.

Our location in physical space is unimportant. Our location in cyberspace is all that matters. Our primary address is the PGP key location: "BlackNet<nowhere@cyberspace.nil>" and we can be contacted (preferably through a chain of anonymous remailers) by encrypting a message to our public key (contained below) and depositing this message in one of the several locations in cyberspace we monitor. Currently, we monitor the following location: the "Cypherpunks" mailing list (cypherpunks@toad.com).

BlackNet is nominally nondideological, but considers nation-states, export laws, patent laws, national security considerations and the like to be relics of the pre-cyberspace era. Export and patent laws are often used to explicity project national power and imperialist, colonialist state fascism. BlackNet believes it is solely the responsibility of a secret holder to keep that secret--not the responsibilty of the State, or of us, or of anyone else who may come into possession of that secret. If a secret's worth having, it's worth protecting.

BlackNet is currently building its information inventory. We are interested in information in the following areas, though any other juicy stuff is always welcome. "If you think it's valuable, offer it to us first."

- trade secrets, processes, production methods (esp. in semiconductors)
- nanotechnology and related techniques (esp. the Merkle sleeve bearing)
- chemical manufacturing and rational drug design (esp. fullerines and protein folding)
- new product plans, from children's toys to cruise missiles (anything on "3DO"?)
- business intelligence, mergers, buyouts, rumors

BlackNet can make anonymous deposits to the bank account of your choice, where local banking laws permit, can mail cash directly (you assume the risk of theft or seizure), or can credit you in "CryptoCredits," the internal currency of BlackNet (which you then might use to buy _other_

information and have it encrypted to your special public key and posted in public place).

If you are interested, do NOT attempt to contact us directly (you'll be wasting your time), and do NOT post anything that contains your name, your e-mail address, etc. Rather, compose your message, encrypt it with the public key of BlackNet (included below), and use an anonymous remailer chain of one or more links to post this encrypted, anonymized message in one of the locations listed (more will be added later). Be sure to describe what you are selling, what value you think it has, your payment terms, and, of course, a special public key (NOT the one you use in your ordinary business, of course!) that we can use to get back in touch with you. Then watch the same public spaces for a reply.

(With these remailers, local PGP encryption within the remailers, the use of special public keys, and the public postings of the encrypted messages, a secure, two-way, untraceable, and fully anonymous channel has been opened between the customer and BlackNet. This is the key to BlackNet.)

A more complete tutorial on using BlackNet will soon appear, in plaintext form, in certain locations in cyberspace.

Join us in this revolutionary--and profitable--venture.

1067. CTCSS finding scanners?

Newsgroup: rec.radio.scanner
Date: 1994-02-15 02:23:29 UTC
From: pthompson@walnut.prs.k12.nj.us
Message-ID: <1994Feb14.222329.628602@walnut.prs.k12.nj.us>
Source record: 277025

I am curious if there are scanners out there that can FIND CTCSS and digital squelch control signals. I own a Bearcat 760 which can decode the tones, but do any have BUILT IN capabilities to determine these tones? Dean McDermott pointed out the products sold by Automated Industrial Electronics Corp- they'll do the trick if I own a high end Radio Shack scanner, in fact, the TCF-4 will decode tone and digital squelch controls and let the scanner use them- a very nice combination. The downside is the $700 or so for the combination.

Is there anything else out there that I should look into before spending that kind of money? The AIE products look really nice, and I'll probably go with one if I don't hear otherwise.

>a regular basis. I suspect battery life (and charge time while listening)
>depends A LOT on how often and long it breaks squelch and how loud you have
>it turned up.

Well, I was counting today... 12 hours and 18 minutes. But that was after
24+ hours of charging (discharge details follow). The PRO-42 manual cites
a charge time of 14-18 hours, but the batteries said 14 hours, so that's
all I gave it on the first time. The PRO-43 manual also states that
the discharge rate when squelched (I assume that's just scanning with no
audio) is 85mA (this model does have a power saver mode that cuts use to
30% of normal if you are squelched (for over 1 minute if I remember) while
manually on one channel, but I wasn't using it in today's test... it was
all scanning). When I went to buy nicads, RS had regular 550mA/hr and
high capacity 850mA/hr (I know capacity is usually expressed as current/time
at a specified discharge rate, which RS doesn't publish). Using the RS
data, I assumed the best possible life would be 550/85=6.5 hours and
850/85=10 hours respectively, assuming squelch was never broken to let the
audio amp consume power. So I went with the 850's hoping for 7-8 hours in
normal use as opposed to what I guessed would be 4-5 with standards (and the
850's were only $1.30/pair more).

Today's use looked like this:

```
Time Used Hours Used Audio
--------- ---------- ----------------------------------------
0730-0900 1.50 Heavy morning traffic... constant audio
(turned up loud in my truck w/mud tires)
1000-1600 6.00 Light... 10-15 secs audio every 5-6 minutes
(normal level in the office)
1637-1807 1.50 Heavy afternoon traffic... constant audio
(turned up loud in my truck w/mud tires)
1907-2107 2.00 Medium... 10-15 secs once or twice a minute
(normal level at home)
2107-2225 1.25 Med Light... 10-15 secs once a minute or two
(normal level at home)
-----
12.25 hours
```

I suppose if the "light" time had been "medium" or better, I'd have lost 2 or more hours. And maybe gained an hour or two if the "heavy" time was "medium." It may be however, that the time for recharge is 18 or more hours. But I certainly can't gripe about the PRO-43's battery life.

1071. Re: 3 letter airport codes?

Newsgroup: rec.radio.scanner
Date: 1994-02-15 06:16:08 UTC
From: haynes@cats.ucsc.edu
Message-ID: <2jppb8$7g1@darkstar.UCSC.EDU>
Source record: 277029

The official source is a U.S. Govt. periodical titled "Location Identifiers" - or at least that was the source the last time I saw a copy. This has the 3-letter identifiers for all the major airports and also a bunch of letter and digit codes for minor places. If you can find an FAA Flight Service station or the Canadian equivalent they can probably show you a copy of the manual, and might give you an outdated one.

Aside from that, this is a FAQ on some newsgroups such as rec.travel.air; and there are some on-line or ftp-able data bases containing a lot of these codes.

> I would appreciate any information on modifications to the
> Radio Shack Pro-2030 scanner for reception of cellular phone bands.

Remove power. Remove the five screws from the bottom of the case with a Phillips screwdriver. Remove the bottom of the case. Place the scanner on its top, with the display facing you. Find jumper L201, located approximately two inches from the right side and one inch from the front. Cut said jumper. Cellular bands and spacings are restored.

Not responsible for physical or legal damage caused by mod.

Hello

I am a student in an aeronautics school in France and I'm going to do my internship in Los Angeles from April to October. Because I am passionately fond of aeronautics and I've got a scanner, I'd like to have frequencies (and further informations, ...) of :
Edwards AFB
Palmdale (Is it the same runway ?)
George AFB
March AFB
Tustin
El Toro MCAS
Pt Mugu NAMTC
Norton AFB
and Los Angeles airports...

I also search for a californian mailfriend (from Los Angeles if it's possible) who would be interested on airshows (military & modern aircraft).

thanking you in anticipation,

Franck.

durieux@reseau.onecert.fr

Note : If someone is interested, I've got a frequency list of all french airports and bases. (.TXT)

>*--*
>

While there isot all of the info there that I'd like to see,
as a free service, it has made my life a lot simpler.
It has the Lat and Long in the info with other basic
info that I can start with. This will reduce the time
that I have to spend with the Broadcasting-Cable Yearbook
by a bunch... and it has the *translators* listed as well
... which is a major boon. That alone is probably enough
to get a number of folks that I know that also do
broadcast engineering to 'go' for a system that has
a connection to the Internet.

In short, *THANK-You* (shouting intended)

Alan Ogden, w6spk

At the end of this month I will be traveling from Harrisburg, PA to Newport, RI. I will have an FT-2700RH 2m/70cm ham transceiver and a RS PRO-2004 scanner in the car to relieve the monotany. I am looking for enroute frequencies to monitor, especially state PD since I will traveling mostly on interstates, and for any interesting Newport frequencies. My route will be I-78 east from Harrisburg to I-287, I-287 north to I-80, I-80 east to the Garden State Parkway, Parkway north to I-287, I-287 east to I-95, I-95 north to SR 138 in Rhode Island and SR 138 north to Newport. I have PA frequencies, so I am looking for NJ, NY, CT and RI frequencies. In order not to clutter up the newsgroup, replies can be sent directly to dave.hultberg@paonline.com. Thanks and 73 from ka3uzr

1077. Future of Scanning (DDS)

Newsgroup: rec.radio.scanner
Date: 1994-02-15 15:58:53 UTC
From: linnig@m2000.dseg.ti.com
Message-ID: <LINNIG.94Feb15095853@m2000.dseg.ti.com>
Source record: 277035

I've been following the direct digital synthesis discussion on rec.radio.amateur.homebrew.

In DDS, you use digital techniques to synthesize a sinewave instead of a phase lock loop. It occurs to me that the PLL is probably what limits the current generation of scanners to the 25 to 50 channels per second range.

I imagine that the next generation of scanners might be able to change frequencies many times faster. It sure would be nice to have a 400 channel per second scanner. If we could also get some SOFTWARE in there, we could really have a radio.

Is this likely to happen soon?

Comments from any receiver gurus?

I can help you out with a few I know, although they are mainly UK and European
ones.

ABZ = Aberdeen
CDG = Paris Charles-de-Gaulle
EDI = Edinburgh
LCY - London City
LGW = London Gatwick
LHR = London Heathrow

Unfortunatley, I can't actually remember many more at the moment. I'll try and
get a list of them sometime soon.

There is an out-of-date copy of the FAA airport information database somewhere out there on the net; try the anonymous account on ftp.uu.net and poke around a bit for a file called "airports.rdb". It's not small (over 1.8 Mb) and it's at least a year out of date. You might be better off buying all seven volumes of the A/FD (less than $7 each), since they are organized by geographic area.

I paid $200 for a CSI CD-1 decoder, which I connected internally
to an Icom R-7100 receiver. It's a darn good gizmo.

The CD-1 employs a large, red LED readout and shows PL, DPL, and DTMF
tones. It is available from several places including
"The Ham Station," in Evansville, Indiana (1-800-729-4373).

Realize that the CD-1 is not a tone squelch, merely a tone reader.

1089. 2006 and imaging/front end

Newsgroup: rec.radio.scanner
Date: 1994-02-15 18:17:50 UTC
From: damelio@bedford.progress.com
Message-ID: <2jr3ke$lp8@progress.progress.com>
Source record: 277046

Hello all,

I just sold my pro-39 becouse of imaging problems on 800Mhz. This flaw ended up being someone else's "feature" because he wanted to hear cell phones, and you could receive them 20Mhz lower without modifying the radio. But for me, I needed to hear what was really on 853Mhz, not what was being imaged there.

So, having said that, I was ready to buy a pro-43, when the 2006 caught my eye. I really don`t NEED my next scanner to be a handheld. I was wondering if the 2006 has triple conversion, or if the filters are good enough that it does not need that technology. The major attractions of this scanner to me are; 25-512 range, and the three modes of operation (FM narrow, wide and AM).

Questions:

Is this receiver image free?
Hows the front end filters?
Are there comparable models I should look at?
Is it 800Mhz modifiable? (not terribly important)
Is there a mail order discount like the pro-43?

E-mail preferred but post if you like.

Thanks,

-Steve

1091. BC8500xlt with CTCSS?

Newsgroup: rec.radio.scanner
Date: 1994-02-15 21:36:10 UTC
From: WILSON@SLUVCA.SLU.EDU
Message-ID: <01H8X3REULHU94EYQ1@SLUVCA.SLU.EDU>
Source record: 277048

I'm looking for some advice out there. I'm looking into getting the BC8500xlt. It says that there is an optional CTCSS option (but not yet avaliable--according to Grove). I don't know what CTCSS is. Could someone please tell me?
Also, the recommended use is for "remote areas for outside antenna." This is a problem because I live in the suburbs of St. Louis. Right now, I have the PRO-2022 with the $18 scanner roof antenna from RS. I often pick up a lot of crap on it--it's hard to describe what it is. It's essentially a lot of noise--and I don't like it! I have a feeling that it is called "intermod" but I'm not sure.
So, if I would buy this scanner w/ the CTCSS, would it cure the problem of experiencing intermod? I'm not too knowledgable with all these terms (as if you couldn't tell).
Any thoughts on the above, and the general performance of the scanner would be greatly appreciated! Thanks...

Peter may I suggest the ham raido from Alinco. The DJ580 can decode any pl
tone or digital squelch. I set the radio to the frequency of interest and
then turn on the type of squelch I am looking for and then while watching
the s meter indicator I cycle the unit through all the combinations until
the squelch opens. The unit will then be displaying the required tone
setting. You can set up to 18 freq in vhf band and 18 in uhf band or by
reprograming it any combination of up to 36 different memories. There are
other ham radios that can do the same thing. The Dj 580 covers 108 thru
136 and 144-172 and 400-512 and 810 thru 1000 MHZ after a simple mod. It
will transmit anywhere in the two middle groups using the proper tones if
they are programed in for any given frequency. This later is illegal. I am
told you can even bring up the various PS repeators if you know what your
doing. These radios make a neat personal radio for cops medics, firemen
etc. and they run less then $500 complete. The Dj580 from Alinco is
supposed to be the most popular radio in Japan among their hams.

Vic Healey Ki4je

Ps Another neat feature of the DJ580 is that you can scan vhf and uhf
simultaneously with both frequencies displaying at the same time. Two
volumn controls and two squelch's etc. I wish radio shack scanners were
built like this!!!!!!!

The Yaesu FT-530 (and probably other ham rigs as well) can scan for
CTCSS codes. Basically you listen to a signal using an unknown code,
set the rig scanning and it will stop on the tone frequency in use.
Rumor has it that it will also identify DTMF codes but I haven't tried
this. The FT-530 is only about $450 so cheaper than $700-- plus you
get an excellent dual band HT thrown in!

This is a periodic reminder that the Boston Amateur Radio Club maintains an FTP area on world.std.com (192.74.137.5) in pub/hamradio.

This area is accessible via: anonymous ftp, gopher, and World Wide Web (and possibly other methods I'm not yet aware of). World is not *fsp*-able yet (I asked them).

Via Gopher, the easiest path to the area is by selecting the following from World's main menu:

18. Membership and Professional Associations

3. Boston Amateur Radio Club

And go from there...

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail me.

Also, up-to-date copies of the files on the ARRL's information server (info@arrl.org) are available in the directory pub/hamradio/ARRL/Server-files.

All text files are uncompressed, so they are both retrievable and viewable via Gopher and World Wide Web. (If you have any troubles with any text file, please e-mail me).

Source code for programs is always welcome. It can permit people to use those programs on other computers with other operating systems.

Scott

The 530, from my understanding, will do it much better than the DJ580.
As far as ease of use goes.

As for DTMF, I pulled this from the net a while back:

DTMF Decoding

A nifty little "feature" that isn't mentioned in the manual.
Steps to follow:

1) tune to the freq you want to monitor and turn on the code squelch
2) press Function-Page(Code) to select a code memory
3) dial up to memory #7
4) watch the dtmf's scroll by as they are heard by the radio!

THE RADIO SHACK PRO-43 PORTABLE SCANNER

by Bob Parnass, AJ9S

The new Radio Shack PRO-43 is a small portable scanner made by General Research Electronics (GRE) which lists for about $350. Although it is a good step above other Radio Shack portable scanners, hobbyists awaiting a portable version of the famous PRO-2006 scanner will be disappointed.1 For instance, the PRO-43 is an "extended coverage" and not a continuous coverage scanner, covering these bands:

30 - 50 MHz
118 - 174
220 - 512
806 - 823.9375
896 - 899.9875

Note the omission of the 10 meter ham band, the 75 MHz band, and the lack of coverage above 1000 MHz.

While the PRO-2006 has 400 channels, the PRO-43 has only 200 channels divided into 10 banks. Individual lockout and 2 second rescan delay may be selected for each of the memory channels. Users may select between AM and narrow band FM on any frequency. The PRO-2006 has 10 pairs of search limits

but the PRO-43 has only one pair and the step sizes are factory set. The PRO-2006 had selectable step sizes.

Both models have 10 "monitor" memories which can be written manually during a search.

The HyperscanTM feature means the PRO-43 is supposed to scan at 25 channels per second and search at 50 steps per second. The radio does scan fast, although not measured by the reviewer. When enabled, the priority channel is checked every 2 seconds. As in the PRO-2006, any channel may be designated as the priority channel.

Physical

The PRO-43 is just the right size for a portable scanner. It is smaller than the PRO-37 and Uniden 200XLT but larger than the tiny Icom R1.2 The gray plastic case feels about the same as a 200XLT, neither as rugged as the Icom IC-2GAT walkie talkie, nor as thin and chintzy as the PRO-37. Inside, there are 3 printed circuit boards and most of the components are of surface mount technology.

The top panel contains volume and squelch knobs, a 1/8" earphone jack, and a BNC antenna connector. A plastic belt clip of dubious strength is fastened to the rear with 2 screws.

A semirigid rubberized antenna is furnished with the PRO-43.

Performance Issues

The PRO-43 and Uniden 200XLT were tuned to the same frequencies both using their stock rubberized antennas.

On 857.4375 MHz, the PRO-43 heard Joliet Police signals full quieting which barely broke squelch on the 200XLT, due partly to the poor 800 MHz performance of the antenna supplied with the 200XLT. When the PRO-43 antenna was placed on the 200XLT, the 200XLT reception improved noticeably, but it was still not as good as the PRO-43.

On 146.94, 162.475, and 460.1 MHz, the PRO-43 and the 200XLT were close in sensitivity.

When connected to an outdoor AV-801 antenna, paging interference rendered several VHF high band channels unusable. The problem disappeared when using the rubberized antenna supplied instead.

Owing to the use of up conversion, a high first intermediate frequency, images don't appear to be a problem as they were on other Radio Shack portable scanners like the PRO-34 and PRO-37. The PRO-43 IF frequencies are specified at 608.005

- 611.2 MHz, 48.5 MHz, and 455 kHz.

Somewhat "Mushy" Audio

The PRO-43 uses an LM-386 audio output IC and the radio is loud enough, but distorts severely when the volume control is advanced too far. This is partly due to the internal speaker as there is less distortion when using an external Motorola lapel speaker plugged into the earphone jack.

The PRO-43 audio lacks high frequency response. By comparison, the Uniden 200XLT has cleaner audio and more of it, especially when using the internal speaker.

Batteries

The PRO-43 requires 6 AA batteries, but none are included. A battery clip slides up into the bottom of the radio case and a separate trap door slides over it. Alkaline cells or NiCd cells will bring the scanner to life. Like most other Radio Shack portables, there are 2 jacks on the side, but they are smaller than usual. An optional, AC operated "wall wart" power supply/charger can power the radio or recharge NiCd batteries.

Keyboard and Display

The user manual explains that the KEYLOCK slide switch "disables the keypad to prevent accidental program changes." In truth, most of the keys are disabled. The MANUAL and SCAN keys remain enabled.

The liquid crystal display (LCD) is a smaller version of the display on the PRO-37. Being smaller, it is somewhat more difficult to read than the 200XLT display. Pushing the LIGHT button lights a single lamp behind the display. It stays lit for only as long as you keep the button pressed and is not latched or timed as in the 200XLT.

Summary

People who want a portable which covers both civilian and military aircraft frequencies should check out the PRO-43. The PRO-43 will be attractive to hobbyists who want more frequency coverage and fewer images in a smaller package than the PRO-37 or Uniden 200XLT and who don't want to fight the problems of using the more feature rich AOR 1000XLT.

July 22, 1992

PRO-43 800 MHZ Modification Pat Murphy Norfolk, Va.

I did the mod on the PRO-43 this morning and was very, very
happy with the results. Yes it restores all of the cellular
at the 30khz spacing and the reception on 800 MHZ is superior
to anything I've seen so far, including the ICOM R-1.

Let me caution anyone wanting to do the Modification to be
SUPER CAREFUL. This is a small unit with little working
space and unless you have a steady hand, excellent light,
don't try it.

USE THIS PROCEDURE AT YOUR OWN RISK. I can only tell you
that I did it this way and it worked very well.

INSTRUCTIONS FOR PRO-43 CELLULAR RESTORATION
1. Remove the battery pack and cover.

2. Remove the four screws on back and GENTLY pry apart.

3. Remove the 6 silver screws from the 1st PC Board.

4. Remove solder from the ground pad and center feed
conductor of the antenna directly under the antenna on the
PC Board heat solder on top PC Board and center feed will
loosen, this is the only really tricky part to this.

5. Disconnect the 2 plugs/wiring harness, make note of the
color scheme for re-installing. Harness has 2-metal
guides on the side....BE CAREFUL NOT TO PINCH WIRES.

6. Lift top board away from bottom, paying careful attention
the black plug near the bottom of the assembly, gently pry
this apart. DO NOT FORCE IT!

7. Remove 2-silver screws from the 2nd PC Board. (remember to
replace on re-assembly)

8. Remove solder from the four points on the large silver
shield covering the microprocessor board. Remove shield.
Make sure to replace shield on re-assembly as this serves
as protection from intermod and interference.

9. Near the bottom you will see a row of surface mount diodes
(very small and square, approx 1/32" long, black with gray
markings) These will be in locations marked D1, D2, D3,

D4, D5. Some of the locations are blank.

10.Use a very low temp iron (15-watt) and the smallest solde wick available, remove the solder from both sides of D4. Use hemostats or needle nose (very small) to grip while de soldering. Remove diode D4. Another method, you could use would be to (use magnifying glass) crush and remove D4 with the needle nose pliers. Make sure all of the pieces are removed and nothing is touching or connecting.
11.Once D4 is removed you will have full 800 MHZ coverage and 30 KHZ spacing on cellular.

12. Carefully re-assemble unit remembering to double check before going on to next step.

AGAIN - - USE THIS PROCEDURE AT YOUR OWN RISK!!!!

The 800 Mhz reception on the PRO-43 is superb.

When you've re-assembled the unit. Hit MANUAL, PROGRAM, LIMIT, 870.00 ENTER, HIT LIMIT UNTIL "H" APPEARS AND THEN 890.00 ENTER. PUSH THE "UP" ARROW AND YOUR IN BUSINESS.

With this modification, this really is a great radio. ENJOY!

Area # 57 SCANRADIO 10-09-93 02:22 Message # 10087
From : Chuck Lackey
To : Darren Golez
Subj : ANY MODS FOR PRO-43 ?

Darren Golez wrote in a message to All:

DG> Hello,
DG> Anyone out there have information on restoring the Cellular
DG> Band 870-890 Mhz for the PRO-43 Scanner?
DG> Darren Golez KI7JM
DG> Spokane Washington
DG> --- Maximus 2.01wb
DG> * Origin: Think Tank II BBS * Spokane, Washington USA
DG> (1:346/8)

INSTRUCTIONS FOR PRO-43 buisness RESTORATION
1. Remove the battery pack and cover.
2. Remove the four screws on back and GENTLY pry apart.
3. Remove the 6 silver screws from the 1st PC Board.
4. Remove solder from the ground pad and center feed
conductor of the antenna directly under the antenna on
the PC Board heat solder on top PC Board and center
feed will loosen, this is the only really tricky part
to this.
5. Disconnect the 2 plugs/wiring harness, make note of the
color scheme for reinstalling. Harness has 2-metal
guides on the side....BE CAREFUL NOT TO PINCH WIRES.
6. Lift top board away from bottom, paying careful
attention the black plug near the bottom of the
assembly, gently pry this apart. DO NOT FORCE IT!
7. Remove 2-silver screws from the 2nd PC Board.
(remember to replace on re-assembly)
Disconnect the 2 wire connector at the top and
remove the 2nd PC board.
8. Remove solder from the four points on the large silver
shield covering the microprocessor board. Remove
shield. Make sure to replace shield on re-assembly
as this serves as protection from intermod and
interference.
9. Near the bottom you will see a row of surface mount
diodes (very small and square, approx. 1/32" long,
black with gray markings) These will be in locations

marked D1, D2, D3, D4, D5. Some of the locations
are blank.
10. Use a very low temp iron (15-watt) and the smallest
solder wick available, remove the solder from both
sides of D4. Use hemostats or needle nose (very small)
to grip while de soldering. Remove diode D4.
11. Once D4 is removed you will have full 800 MHZ coverage
and 30 KHZ spacing on
buisness.
12. Save the diode you removed from the D4 position and
install it in the D3 position being careful to make
sure the diode is facing the same direction it was in
the D4 position. (same as D2) This will increase the
low band coverage from 30-50 to 30-88 Mhz.
13. Carefully reassemble unit remembering to double check
before going on to next step.

USE THIS PROCEDURE AT YOUR OWN RISK!!!!

The 800 Mhz reception on the PRO-43 is superb.
When you've reassembled the unit. Hit MANUAL, PROGRAM,
LIMIT, 870.00 ENTER, HIT LIMIT UNTIL "H" APPEARS AND THEN
890.00 ENTER. PUSH THE "UP" ARROW AND YOUR IN BUSINESS.
With this modification, this really is a great radio.
ENJOY!

My thanks to CompuServe for this one and Howard Bornstein.

1104. Re: PRO-43 mod: S meter.

Newsgroup: rec.radio.scanner
Date: 1994-02-16 09:29:57 UTC
From: dan@halcyon.com
Message-ID: <2jsp2l$5lf@nwfocus.wa.com>
Source record: 277062

This file is called p43smetr.txt on my system.

```
```

```
```

```
```

|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The
lack of treble makes it difficult to hear the PRO-43 in
noisy situations, especially while listening in a car
or truck. Louis Shirley sent me a schematic and sug-
gested I remove C341, a tiny 0.015 ufd surface mount
capacitor.

I'm glad to report that removing C341 made a great
improvement. The audio is now much "crisper," more
like the Uniden 200xlt, although still not quite as
loud. Turning the volume control up still overloads
the PRO-43's small, internal speaker, but there's less
need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the
middle (second) board contains the audio circuitry.
Finding C341 is difficult, as it is neither marked with
a value nor a component designation. It is located on
the foil side of the middle board, under IC304, an
LM386 amplifier IC. C341 is in parallel with, and phy-
sically next to, R350 (33,000 ohm). R350 is slightly
larger than C341 and is marked 333. Both R350 and C341
are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European
version of the PRO-43 has different coils and capaci-
tors in the low (mid) band front end filter. That
explains why the 75 MHz sensitivity isn't stellar after
adding diode D3 to enable 30-88 MHz coverage.

I had tried an AOR 2500 (or something like that, the .1-1200 MHz scanner) and had very serious trouble with images from UHF TV stations and other sources, so I returned it. On various reccommendations, I got a 2006 instead. In the same location and with the same antenna as the AOR:

> Is this receiver image free?

Yes. I don't get any noticeable images even from strong UHF TV stations or other sources that I know of.

> Hows the front end filters?

Apparently fairly good.

> Are there comparable models I should look at?

Other RS units, I suppose.

> Is it 800Mhz modifiable? (not terribly important)

Yes, at least for now.

> Is there a mail order discount like the pro-43?

I bought mine from EEC in Virginia for about $60 less than the local R.S. Store. I believe there are other mail-order sources.

: second scanner. If we could also get some SOFTWARE in there, we could really
: have a radio.

: Comments from any receiver gurus?
Sure,

Personally, I have 2 (200) channel scanners, and I'm absolutely convinced
that having 10 10 channel scanners is better than 1 200 channel scanners.

Not that I don't like a multiple channel scanner, (IE 400) but, for
monitoring purposes, having multiple scanners set up with repitition,
at least the same frequency in at least 2 scanners, allows you to hear
almost everything, (of course there are exceptions.) The ideal way
to have it, in my mind, is to have one scanner for each frequency you
want to listen to. That way, you would only be limited to how many
ears you have. So, in the future, I would personally like to see a scanner
that has 2 speakers, one for one frequency, and the other speaker for
a different frequency. So in a sense, one would be talking, while the
other speaker would be scanning. (I think you might understand what I'm
botching here.)
I'm having a BTK error this morning. So bear with me.
(Brain-To-Keyboard)

Any other comments? I'd love some input.

Carter

>I've found some cellular frequencies between 900 and 910 Mhz.
>There are also 10 cordless phone frequencies between 46.6 and 47 Mhz.

Nice try! Try this on for size...

The following was assembled from a variety of articles previously posted
regarding CORDLESS/900MHz/CELLULAR phones.

****
46/49 MHz CORDLESS TELEPHONE FREQUENCIES

There are 10 frequency pairs assigned to cordless
telephones in the 46 MHz band. Both sides of the
conversation can be heard on the "base" frequency.

46.610 base 49.670 handset
46.630 base 49.845 handset
46.670 base 49.860 handset
46.710 base 49.770 handset
46.730 base 49.875 handset
46.770 base 49.830 handset
46.830 base 49.890 handset
46.870 base 49.930 handset
46.930 base 49.990 handset
46.970 base 49.970 handset

****
900 MHz Cordless Phone Info. The following has not been verified.

Panasonic 900MHZ Cordless Freqencies

Color of Phone	CH	BASE	HANDSE
Blue	01	902.100	926.10
Hot Pink	02	902.130	926.13
Banana	03	902.160	926.16
Cerise	04	902.190	926.19
White	05	902.220	926.22
Off White	06	902.250	926.25
Gray	07	902.280	926.28
Fuschia	08	902.310	926.31
Shocking Pink	09	902.340	926.34
Chartreuse	10	902.370	926.37
Neon Purple	11	902.400	926.40

.
.
.
Black 59 903.870 927.870

The phones probably scan each freq until a noise-free channel is found. They then stay at that freq until the call terminates or the channel becomes noisy. The original post suggests that each color has a unique frequency. I doubt if that is the case!

Vtech TROPEZ

The Vtech TROPEZ phones operate in the 900 MHz band but NOT at the same frequencies as listed above. The TROPEZ line uses digital data (digitized voice) that is also encrypted. They cannot be monitored with only a scanner. They use conventional narrow FM modulation and, despite claims by others, do NOT use any form of spread spectrum (such as frequency hopping or direct sequence). Again, note that the data transmitted is digital and not analog.

****

Cellular phone channel construction

Here is a method of determining which frequencies are used in a cellular system, and which ones are in what cells. If the system uses OMNICELLS, as most do, you can readily find all the channels in a cell if you know just one of them, using tables constructed with the instructions below.

Cellular frequencies are assigned by channel number, and for all channel numbers, in both wireline and non-wireline systems, the formula is:

Transmit Frequency = (channel number x .030 MHz) + 870 MHz
Receive Frequency = (channel number x .030 Mhz) + 825 Mhz

Ther terms "transmit" and "receive" apply to the cellular system tower's view of the world. The "TRANSMIT" frequency is used for transmitting FROM THE CELL TOWER TO THE MOBILE UNIT. The "RECEIVE" frequency is used for transmitting FROM THE MOBILE UNIT TO THE CELL TOWER. You will have best results scanning the "TRANSMIT" frequency range. You are also likely to here both sides of the converastion in this range.

"Band A" (one of the two blocks) uses channels 1 - 333. To construct a table showing frequency by cells, use channel 333 as the top left corner of a table. The next entry to the right of channel 333 is 332, the next is 331, etc., down to channel 313. Enter channel 312 underneath 333, 311 under 332, etc. Each channel across the top row is the first channel in each CELL of the system; each channel DOWN from the column from the the first channel is the next frequency assigned to that cell. You may have noted that each channel down is 21 channels lower in number. Usually the data channel used is the highest numbered channel in a cell.

"Band B" uses channels from 334 to 666. Construct your table in a similar way, with channel 334 in the upper left corner, 335 the next entry to the right. The data channel should be the lowest numbered channel in each cell

this time.

Applying channels 1 through 666 to the above formulas gives...

Transmit band: 870.03 to 889.98 MHz
Receive band: 825.03 to 844.98 MHz

(Scan both bands in 30 kHz steps)

****

That should help eliminate any confusion.

I don't have the sectional here, but here's what it might be: there are established "reporting points" that are used in communications with the tower (or approach), and lots of airports have some informal ones as well. The official ones are marked with a little flag - if you can look at the sectional for that area, you might see one of them is a park, or something named Park.

If the park you watch from is that close to the airport, it probably isn't the one the pilots are talking about (even moreso if it's just a little one). Think more along the lines of 15 or 20 miles out.

The Universal M-400 is a multi-mode decoder for both scanner and shortwave. It has DTMF, PL, and DPL decode, and can be programmed to act as a code squelch. It will not store a different squelch tone for multiple freqs however. On the other hand there is the Icom 2SRA that covers 25 -950 MHz and has a 2m xcvr. This unit has tone decode built in (as in tone squelch not in showing you what PL is being used). The 2SRA is a nice unit but does not have multiple scanner banks (only 60 channels).

I am currently using an RS 2028 scanner and I am happy with it except for the fact that I need to use an external converter to get 800 Mhz and listen to the local PD.

I'm ready to upgrade to a new scanner and would be interested in hearing your recommendations for a portable in the $300 range. I would like to have 800 Mhz coverage ("full 800 Mhz" coverage would be nice but is not #1 on my list of features). Small size and good performance are my major desires. Next would be large a large # of memory locations (I am in the NYC area and there's lots of stuff to monitor).

Many thanks
Al Berg

One of the reasons I mentioned software was that I felt that a lot of tricks could be done in software that are not being done today.

My BC200 has a priority feature that periodically looks at a priority channel while I hear non-priority audio. To do this, the BC200 retunes (slowly) to the priority channel and then back. This generates an annoying audio dropout that causes me to not use the feature.

With fast tuning, this dropout wouldn't happen. In fact, you could use software to assign relative priorities and have the radio check many other frequencies while you are listening to the driveup window audio at McDonalds.

Another software trick I'd like to see is to have the radio scan frequencies based on their likelyhood of having a signal. I like keeping some media frequencies in my BC200 so I can hear the latest helicopter traffic reports. These are unusual transmissions and they last for 30-60 seconds. If my scanner could only look at those frequencies a couple of times a second, that would be fine. Other frequencies, such as the local police, might rate a higher rate because they are very frequent but short. I get tired of hearing "... is at the scene" when the full transmission would tell me that "SWAT TEAM is at the scene".

Another software feature would be to have an ASCII display of that I can program, to associate a name with a frequency. This is probably only practical with a PC interface. Speaking of PC interfaces -- how hard can it be??

The manufacturers just need to spend an extra 5 bucks per CPU and the radio will have enough speed and memory to be fun. As it is now, I think they must be using tiny 4 bit cpu chips designed for calculators or something.

I had a few questions about your new 900MHZ phone. I am thinking about getting one and want to know a couple of things. First, (the obvious) how far does it go? Do you know what the output of the base and handset transmitters are? Does it use a low power and high power switching method (like that of Cellular phones)? Thanks in advance.

1122. Update for Periodic Reminder of World FTP site

Newsgroup: rec.radio.scanner
Date: 1994-02-17 00:28:47 UTC
From: wy1z@netcom.com
Message-ID: <wy1zCLCEo0.Cpp@netcom.com>
Source record: 276930
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.scanner

This is a periodic reminder that the Boston Amateur Radio Club maintains an
FTP area on World - ftp.std.com (192.74.137.7) in pub/hamradio.

This area is accessible via: anonymous ftp, gopher, and World Wide Web
(and possibly other methods I'm not yet aware of). World is not
fsp-able yet (I asked them).

Via Gopher, the easiest path to the area is by selecting the following
from World's main menu:

18. Membership and Professional Associations

3. Boston Amateur Radio Club

And go from there...

Please feel free to browse through the area.

If anyone has any questions about it, please do not hesitate to e-mail me.

Also, up-to-date copies of the files on the ARRL's information server
(info@arrl.org) are available in the directory pub/hamradio/ARRL/Server-files.

All text files are uncompressed, so they are both retrievable and
viewable via Gopher and World Wide Web. (If you have any troubles with
any text file, please e-mail me).

Source code for programs is always welcome. It can permit people to use
those programs on other computers with other operating systems.

From: mbm1949@u.cc.utah.edu
Message-ID: <2jut7m$ido@u.cc.utah.edu>
Source record: 276937

IMPORTANT: I have not verified this procedure nor can I take credit
for it.

I hate to lecture, but here are some points to ponder.

1-It is against the law to monitor cellular or mobile telephone calls.
2-Procedures outlined below require knowledge of microcircuits, soldering
and assembly techniques.
3-You will need a low-wattage soldering iron, solder and other various tools
to help in the procedure.
4-The following procedure will void your warranty.

Good luck, remember don't do this after a six-pak of beers and don't
call me if it doesn't turn out.

As you disassemble the unit try to place the parts in a logical order
or placement to help you remember the re-assembly.

Step 1

Remove the battery, antenna, and back cover which is held in place by four
screws.

Step 2

Remove the six screws holding the top circuit board in place.
Carefully unsolder the two antenna connections from the board. Bend the
antenna ground tab fully up from the board. Carefully lift the board,
unplugging the black connector at its base, and lay the board out of the
way on its bundle of colored wires.

Step 3

Remove the two screws from the next board and lift it, carefully
unplugging the white connector at the bottom of the board. Lift it
up and lay it aside on its brown wire--which can be unplugged if
necessary.

Step 4

Unsolder and remove the metal shield from the final board, revealing
the microprocessor, note the row of diodes labeled D1-D5 above it.

Only diodes D1, D2 and D4 should be present. Use a small pointed
tool to pry up one end of D4 while unsoldering it. Try to pry
or pull from one end, at the wire, not in the center, while heating
up the solder on the same end.

You actually don't have to remove it completely(unless you want to use
it to restore additional frequencies--see step 5).
You can just lift one side so it dosen't make connection and then
put a small piece of tape or heat shrink over it, so it won't.
Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

If you decided to take the diode D4 all the way out then you
can solder the removed diode carefully into position at D3
to extend low coverage to 88 mHz.

Step 6

Ressemble the boards, paying attention to alignment, plugs and
test it.

Additional Notes:

One author writes:

...be careful about re-installing the diode for 51-88 mHz. In
earlier Pro 34/37 models this could be done but the scanners
would not pick up anything and would remove the 30-54 mHz band....

Another author writes:

...the diode positions on the cpu board, of which only three are
filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

1130. Re: Future of Scanning (DDS)

Newsgroup: rec.radio.scanner
Date: 1994-02-17 05:42:41 UTC
From: kronz@schooley.ecn.purdue.edu
Message-ID: <CLCt76.E0D@noose.ecn.purdue.edu>
Source record: 276938

Im no expert by any means but here's what I think...:

DDS does basically take a digital input and create a signwave that
you can use in mixing etc..And recievers like aor-1500 and I imagine
yupiteramvt7100 use such chips to get the superwide freq range:

BUT, these to my knowledge do not take the place of the PLL...

Even thought they create the signwave the do not lock onto the phase
of the incomming signal thus a PLL is still needed... Like I said
before I may be totally wrong on this (technology just seems to move
TOOOO fast anymore)

Really DDS chips are the best thing to hit the market as far as
homebrew equipment... With all the govnment regulation going on
in a couple years we all may have to secretly build our recievers
at home (I hope it doesn't come to this!) And DDS will make that
job Incredible easier!

Thats my 2 cents

That's interesting. When I walked on to an American flight (727 O'Hare to Toronto) with my Yaesu FT-470 clipped to my belt, the lead flight attendant almost had a heart attack. She asked me to remove the battery pack from my radio and stow it in my hand luggage for the duration of the flight. I've also had similar problems with scanners on American (and United).

Hello scanning people out there on the internet.

I recently purchased a Pro-46 scanner, which is quite nice for the $150 price (new) I found it for. One of the FEW problems (or things I would like changed) on it is that EVERY TIME YOU HIT A BUTTON IT BEEPS. That is about as annoying as me typing IN CAPS ALL THE TIME (right?) Seriously, I really would like to find a way to turn off htat beep w/o changing the other operations of the scanner. Surely someone out there has this same scanner and has figured a way to kill that BEEP. So, please enlighten the rest of us with your vast knowledge about the PRO-46.

Thanks a bunch,
Matt Clarke

I always always always talk to the pilot. I never trust what the flight attendants say. Usually, the pilot will let you listen with your radio. I have flown on numerous Northwest and United flights and have never ever had a problem using my radio.

I am also a pilot myself, which kinda helps to break the ice to begin with! :) :) :)

I got my new Pro-43 and had a successful modification procedure!
And I could use some good frequencies in Boulder. ie. Police, or airport, or
other stealth freq.

I already had the opportunity to hear some cordless, and let me tell you
that these college kids talk about all sorts of drug deals. hehehe
(They must be pretty stupid)

-Thanks

Just a quick note to all owners of the ubiquitous Bearcat 100XLT or 200XLT:

If you have modded the unit with a light switch to keep the backlight on at all times, you might want to make sure when you're changing battery packs, or temporarily disconnecting the pack for some reason, make sure that you turn the light switch off until you get power back to the terminals. I found out the hard way, and then by trial and error, that if the switch is left on and the power disconnected from the main unit, the memories are either all locked out or all unlocked, with reset of all memories a probable occurence. You'll save yourself a bit of aggravation if you simply turn off the light when the unit is off, thus insuring longer memory life while in storage. Any other similar experiences?

>BUT, these to my knowledge do not take the place of the PLL...

Well, you're mostly right so far. But, DDS is highly constrained in terms of the frequencies that can be synthesized, for one thing.

>Even thought they create the signwave the do not lock onto the phase
>of the incomming signal thus a PLL is still needed... Like I said
>before I may be totally wrong on this (technology just seems to move
>TOOOO fast anymore)

Oops. Phase-locked-loops, in the context of scanning receivers, do not generally lock onto the phase of the incoming signal. The phase-locked-loop is usually used to stabilize the frequency of a variable frequency oscillator to a desired value.

>Really DDS chips are the best thing to hit the market as far as
>homebrew equipment... With all the govnment regulation going on
>in a couple years we all may have to secretly build our recievers
>at home (I hope it doesn't come to this!) And DDS will make that

Thanks for reading this post. I have a Kenwood R-2000 shortwave receiver for sale. It is in EXCELLENT condition and has the owners manual and the original shipping carton.

Major features:

Variable tuning speeds
Ten memories
Memory and Band scan
Dual clocks with a timer
Built-in AC power supply

Price: $350.00

Call (919)942-2279 or E-mail Kenneth.Guthrie@launchpad.unc.edu

Thanks.

1154. My BC2500XLT

Newsgroup: rec.radio.scanner
Date: 1994-02-18 15:12:08 UTC
From: trig@uncvx1.oit.unc.edu
Message-ID: <1994Feb18.111208.1@uncvx1.oit.unc.edu>
Source record: 276962

I bought a Uniden BC2500XLT scanner from Communictios Electronics Inc. out of Ann Arbor, MI in December. I really like the look and feel of the radio; it offers numerous improvements over the BC200XLT, especially useful is the 100 cps speed and auto search-and-store. HoweverI was really dissapointed to learn that my BC2500 does not actually receive Wide-band FM. The frequencies appear on the display during "search" and they can be stored as channels, but several weird things happen:
- The scanner searchs these frequencies much slower than the specified 20 or 100 cps, even in turbo mode
- The scanner never stops during a search of WFM freqs, even with the squelch turned all the way down (or up?)
- When a WFM freq is programmed, the scanner stops on it during scan, but there is no sound at all.

Has anyone had a similar experience with this radio? I am somewhat new to the net so please forgive any repetition. I am just eager to know if there is something wrong with my scanner or if the specified range of the radio by Uniden is simply not true.
Thanks in advance for any comments.

Not if he had permission from the pilot. According to FCC Part 97, the
only requirements that an amateur transmitter on board an aircraft
have are :

1. The antenna and transmitter must be installed separately
and independantly of the plane's other systems
2. You must have approval of the pilot in command.

PLEASE PLEASE PLEASE lets not start this AGAIN! This discussion pops up
on every rec.radio. group about every 8 months. There are really no clear
answers to this. Some airlines let you have HT sometimes, others don't.
Rules or no rules, your on their plane and whichever poorly trained employee
tells you do something with your radio, you pretty much have to comply unless
you appeal to high authority.

Lets drop this. I think they even put this in the rec.radio.amateur.misc FAQ!

1159. Pro-2006 va. AR2500 vs. ?

Newsgroup: rec.radio.scanner
Date: 1994-02-18 16:29:00 UTC
From: Scott.Fabbri@launchpad.unc.edu
Message-ID: <2k2qcc$ams@samba.oit.unc.edu>
Source record: 276967
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi, all,

I'm thinking of buying an "upgrade" scanner. I'm kind of leaning toward a Rat Shack PRO-2006, but I heard the AOR AR2500 was a good one, too. My problem is that I live in a heravily urban area (Washington, DC) and need plenty o' channels to organize the stuff I listen to. Therefore, I want at least 400, and more is better. I also want military air freqs; shortwave is OK, but not necessary.

Is there anyone out there with useful info to help me make the decision? The 2006 is cheaper, but I've heard it's great for the money. I can live with buying a separate shortwave receiver later on.

Also, has anyone done any of the mods to the 2006, especially the 'more channels' one? If so, how easy are they? (I can wield a soldering iron, but I'd rather give it to someone I know who does it for a living.)

Thanx in advance,

Scott

The dropout is not related to the speed of the software; it is caused by
the physics behind the design of the analog circuitry in the frequency
synthesizer.

You cannot change frequencies quickly without spending big bucks on the RF
circuitry in the frequency synthesizer.

He must still comply with the FAA regulations, since the operation occured within a U.S.-registered aircraft. Quoted verbatim (and I tried to proof-read this one) from the Federal Aviation Regulations:

Part 91 -- General Operating and Flight Rules

91.21 PORTABLE ELECTRONIC DEVICES
(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.
(b) Paragraph (a) of this section does not apply to --
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier

operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

Interpretation:

1. Unless the air carrier has explicitly authorized the use of the device, or its use is explicitly authorized by 91.21(b), its use is not permitted. 91.21(a)(1).

2. For air carriers, such as American Airlines in this case, the authority to authorize operation of a portable electronic device under 91.21(b)(5) lies with the aircraft operator (i.e. American Airlines), not with the pilot in command. 91.21(c).

3. Different air carriers are explicitly permitted to have differing standards regarding this section. In plain language, if Delta permits a device on its aircraft, that does not mean that United has to permit the same device on its aircraft. 91.21(c).

Has anyone used the discone scanner antenna ($79.95 CDN) from Radio Shack?
How does it compare in terms of reception and durability with the
various discones advertised by other manufactueres in magazines (usually
for about $40 US)?

1168. Yupiteru 7100/antenna mismatching question

Newsgroup: rec.radio.scanner
Date: 1994-02-18 21:01:17 UTC
From: uhap023@vax.rhbnc.ac.uk
Message-ID: <1994Feb18.210117.1@vax.rhbnc.ac.uk>
Source record: 276976
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I am attempting to use a recently acquired Yupiteru 7100 for monitoring the VHF TV bands for DXTV signals. However the performance is no better than the TV tuner/upconverter system I have been using for some time. I would have expected to be able to hear the AM vision buzz long before a picture is strong enough to appear on the TV but not so. Using my band-I yagi (40-80MHz) there often seems to be a high level of "noise" present -ie. several of the signal strength indicator digits are lit but no "busy" and just hiss/hash when "monitor" is pressed. Performance in general seems OK with the telescopic aerial so I don't think the scanner is faulty. Being TV aerials they and the cabling are 75 Ohm but the scanner is expecting 50 Ohm. So my question is: Is the problem likely to be mismatching? How sensitive in practice is the scanner likely to be to it? Would a 75-50 Ohm matching Balun/transformer be what I need? Finally its *just conceivable* the coax downlead might have been damaged (ie. crimped somewhere etc.) in some way which affects its transmission properties but does not prevent it checking out OK on DC continuity tests. I have the impression that its performance is not as good as it used to be but no hard evidence against it unfortunately. This could of course exacerbate mismatching problems.
Thanks...
Tom.

1169. "Fireground"

Newsgroup: rec.radio.scanner
Date: 1994-02-18 21:11:26 UTC
From: jkearman@arrl.org
Message-ID: <1994Feb18.211126.10402@arrl.org>
Source record: 276977

I goofed and posted this to the shortwave group yesterday. Since nobody answered, I don't feel so bad about reposting it here.

In Connecticut, fire companies are often assigned two frequencies. One is "local operations," the other is "fireground." I'm wondering about the use of 'fireground.'

Is this term used elsewhere? What's it mean/how did it come about?

Thanks.

Good listening.

Jim

Sounds like there is something wrong with your 2500XLT. I don't think I have tried to search FM BCB or TV band but if I program in a frequency it works fine. Oh, I just remembered something. When you use WFM you really have to open the squelch up ALL THE WAY. This is not particular to the 2500. It is the same on my R-7000, 2005, and 2SRA. So searching wideband freqs really doesn't work too well. I don't know why you would want to though. The TV freqs are known as are FM BCB. Maybe you just need a list of TV audio freqs. There really isn't anything else broadcast in WFM. So chances are your 2500 is fine. BUT, if you program in a WFM freq and then open the squelch all the way and you dont hear anything, then you may have a problem. Test it out on a local FM station.

I don't recall seeing too many discones advertised for $40 but as far as performance is concerned, discones are good wide-band antennas, but if they do not have a vertical element sticking up at the top, its frequency range will probably bottom out at about 100MHz. The Diamond discone has better construction than the RS and HAS the vertical element. It is probably the most cost effective discone I have seen. (about US$80)

97.11 Stations aboard ships or aircraft.
(c) The station must not constitute a hazard to the safety of life or property. For a station aborad an aircraft, the apparatus shall not be operated while the aircraft is operating under Instrument Flight Rules, as defined by the FAA, unless the station has been found to comply with all applicable FAA rules.

So, Dave, you apparently assume either that he endangered life or property, or that the flight was entirely hard IFR and no one found the transceiver to comply with FAA rules. Perhaps you'll tell us why you thought that.
However, apparently American, or the pilot of the flight, thought otherwise, in which case Jeff was NOT in violation.
The pilot was there; you weren't; I side with the pilot.

I have one and like it for it's performance over 130 Mhz. A discone is good for a 'decade' of coverage - 30 Mhz to 300 Mhz, 100 Mhz to 1000 Mhz or 130 Mhz to 1300 Mhz. Radio Shack is not really honest when they say that it covers 25-1300 Mhz. Sure, it works below 130 Mhz, but the performance drops way off. Note also that discone antennas have no gain and are useless for applications where the signal is above the horizon (such as for shuttle reception). Discone antennas are very versatile for amateur use since they can be used to transmit through their 'decade'.

There are some modified discone antennas on the market that will perform below the 'decade'. The one sold by Grove is made by diamond and it has an additional vertical element mounted on top. This provides coverage down to 25 Mhz and some have had good luck even lower. I don't know how this top element changes the transmit characteristics.

I notice that the Radio Shack discone has a handy threaded stub on top and I have thought about adapting a mobile CB antenna to this. Somebody once told me that a CB antenna is what is used atop those with top elements.

Arguably the best handheld scanner ever made.
I have a huge file of reviews on the MVT-7100; I'll email it to you.

Your second question is impossible to answer; there are no American made
scanners.

My guess is that the "noise" you are hearing is due to intermodulation
products that are symptomatic of front end overload. You may be feeding it
more signal than it can handle.

From: der@anomaly.sbs.com
Message-ID: <2k3pfe$99h@paperboy.ids.net>
Source record: 276990

I am currently doing a research project on cellular phone
conversations and the myth that the cellular industry likes to
propagate that cellular phone coversations are somehow "private".

I recall reading several months ago an article describing a
device which can be interfaced with several different scanners
that allows people to monitor cell calls, and display certain
information about the call - including "following" the call when
it changes cell locations.

I'd like to get some information about this product to include in my talk,
but can't find any reference to it. If someone knows what I'm
talking about (after all, I certinly don't :-) can you please
e-mail me the company name so I can contact them? I believe the
company name was CSI, and it was based in Canada somewhere...

Thanks,

Dave

I have an archaic set of Jepp approach plates for SEA & they show "Park" as the outer marker for rwys 16 L/R. Park is (was) located at 5.8 DME on the 338 radial of the SEA VOR. The identifier was SZ & the freq was 281.

NOTE: These appraoch plates are 20 years old, so don't trust any of this for anything important! For purposes of scanning, however, it may still be approximately correct.

Steve.

Maybe that will be the straw that causes our apathetic population to get
rid of a good hunk of your useless bureaucracy and their laws.

: Yup. Have fun now kids, it'll be over soon...

Don't count on it kiddo. What can be coded, can be decoded. Or, the radios
can be stolen. Yes, I know all about the reprogramming of the algorythm
that can be accomplished either on-line or off-line. But, just like with
everything else, if people want to listen bad enough, they will figure out
a way to do so - regardless of Motorola's fond wishes otherwise. Remember
Video-ciper, which was supposedly unbreakable (even the video portion)?
Seems it only took a year or two before that was proven to be false.

The day that I can no longer monitor the day to day operations of the police,
if I so desire, is the day that they are no longer my friends.

Well, Fireground frequency here is used for exactly that, Fireground
operations, which is probably where the term originally popped up.
There is no real need for a repeater to be in use on a fireground, since
the portables (never work during a REAL fire anyway-but work great on drill)
The signal dosen't need to go much farther than the other end of the building,
but our county dispatchers listen to the fireground frequencies too, and since
we, Here in Montgomery county Pennsylvania, don't use a repeater for our
regular low band fire frequency, we use the fireground frequency if the
county needs the original dispatch frequency to dispatch more fire calls.

I don't know if I answered the question, but I tried. Any other
comments welcome on this one.

1194. Re: "Fireground"

For the most part in the NW US fireground means an on-scene freq. not dispatch. It is often a low power simplex freq. In Washington we have a state-wide low power freq of 153.82.

>modifications to and still not have gaps.

The R1 is a poor choice as a primary/first scanner because it has serious
performance deficits due to design compromises for small size.

The AR1000 is complicated to program and suffers from poor quality control
(in units sold in the USA anyway) but is generally OK. The AR1500 costs
more and delivers less, except for manual SSB and useless auto-store
during search.

I'd grab the Radio Shack PRO-43 before it disappears and get someone to do
the 20 minute restoration mods.

>

The "Subject" line was quite clear on the "Airport Identifiers" post, could you not have simply ignored it? I did. I saw it was multi-part and not of particular interest to me, and so I passed it by. Is your newsreader structured such that you *must* download to read the Subject or determine the number of parts to a post?

The reason I'm defending this is that I don't want to see "meaningful" data going away. Sometimes (such as in the alt.binary.* groups), size *is* important. I'd sooner see the constant requests of "I need the frequencies for Baby Monitors in Podunk Iowa" go away. Buying a book of frequencies was one of the very first things I did when I began scanning (more years ago than I care to remember).

Just wondering . . .

1201. Re: Radio Shack Pro-51

Newsgroup: rec.radio.scanner
Date: 1994-02-19 20:14:52 UTC
From: cravitma@cps.msu.edu
Message-ID: <2k5rvs$uj0@msuinfo.cl.msu.edu>
Source record: 277009

I just bought a Radio Shack Pro-51 (seems to be a replacement for the Pro-43, according to the local R.S. salesdroid), and although I have only been playing with it a few hours, I thought I'd post a few observations:

* Power Source : 4 AA batteries. Two fit into the back of the radio, two fit in to the battery compartment door, which connects to the radio by a pair of connectors near the locking tab. Also powerable from AC. Has jacks for charging NiCads.

* Frequency Range : Covers 29-54, 108-174, 406-512, 806-823.937, 851-868.937, 896.112-956 (cellular excluded)

* Memories : 200 + 10 monitor. Any 1 channel can be designated the priority channel. Channels are grouped in 10 banks of 20 each.

* Searching/Scanning : Scanning speed is 50 ch/second. Includes direct search (search up from xxx.xxx MHz), limit search (search from xxx.xxx to xxx.xxx MHz). Search freqencies can be stored in 10 monitor memories, and later moved to any memory. Automatic search for Air (108-136), Fire (all VHF/UHF ranges where fire is usually found), Marine (156-158, 161-163) and Weather (NOAA channels). Channels found this way may also be stored.

* Audio : Not too bad. Could be louder (250 mW max), and an amplified external speaker doesn't hurt.

* Dimensions : 6-1/16 x 2-7/16 x 1-11/16 inches (HWD), 8.11 oz.

* Price : $299.99 + tax

I will try to post more performance data after I have played with it a bit.

/Matthew

Here's my post from a while ago describing one such device. It
can be interfaced to decode data from almost any scanner from which
you can get clean audio (ie., from the discriminator) but to
automatically follow calls requires a scanner with RS-232 interface
(like an Icom 7100 or Pro-2006 with the CRB 232 mod.)

Regards,
Eddy

The August '93 Nuts & Volts magazines has a review of the CSI, the
Cellular Surveillance Interface test set on page 81. It's a "little box
[that] can do an awful lot when coupled to a good scanner and an IBM-
compatible computer." I found it very interesting; I'm amazed that
someone hasn't come out with a cheaper version with the wide-spread
availability of cellular-specific ASICs out there. Below are some
extracts from the article; see the whole thing for pictures and sample
data output from the device.

The CSI "allows you to survey the messages being broadcast over a
control channel or being spit out by a phone." The device is marketed by
Spytech, a division of Electronic Countermeasures Inc. of Canada. "The
CSI will interpret data on the control channel from any scanner capable
of receiving wideband FM and delivering quality audio. Many stock
scanners can be modified to provide this clean signal to the CSI. The
firwmware outputs plain ASCII text at 9600 baud and could be used with a
dumb terminal."

"In one mode the CSI follows the first call on the forward control
channel directed to a voice channel. When the call is completed, the
unit returns to the control channel and displays the overhead message
data until another call is processed and handed a voice channel. Then
that call is followed from frequency to frequency to frequency. One of
the other CSI modes just displays all of the data streaming on the
forward control channel and doesn't follow any calls. It can also be
programmed to track voice calls when they involve a specific cellular

phone."

"While the CSI can control an ICOM radio directly, it can also control other radios via the PC software when the radio is equipped with a serial port for computer control. Manufacturers such as Datametrics produce kits to add this feature to several popular Radio Shack scanners. The CSI is then connected to one of your PC's serial ports while the radio is connected to another RS-232 port." Spytech has modification kits and instructions for many scanners to get audio of sufficient bandwidth to the CSI, and includes the appropriate info with your order.

The device is available for US$394 until 12/15/93, including shipping and modification info for your radio if available. An info packet is available for $3.00. E-mail info is available via bill.fischer@t8000.cuc.ab.ca if you'd like an on-line reply. There address is Spytech, Division of Electronic Countermeasures, Inc., 65-31 Avenue South West, Calgary, Alberta, Canada T2S 2Y7.

If you want a copy of the EIA standard on the format of the cellular data fields, you can purchase the "Cellular System Mobile Station -- Land Station Compatiblity Specification" from:

I just bought my third Pro2006. I think it is very good value
to the money.

Clipping the diode lead to make the mod take count em 30 seconds
starting with a phillips screwdriver and a small pair of diagonal
cutters.

The only pice of equipment that has more bang for the buck
is the ICOM W2A HT transceiver that can act like a VHF/UHF
scanner with limit search, channel lockout, priority, etc.
AND you can modify it to transmit on most of the frequencies
you can receive. 120 -174 MHz 420-460 Mzh 800-900 MHZ (no xmit on 800).

: for about $40 US)?

The Radio Shack discone (the higher priced one) is an excellent and
durable antenna. Works very well VHF/ UHF and can be used for
tranmitting with low SWR on 2m 70cm and 23cm amateur bands.

Can someone please advise me on the proper coaxial cable type for
use with a Pro 2006 scanner and an Icom discone antenna? It seems that every
vendor I talk to tells me something different. Is there a less expensive
alternative to RG8 cable? If I use Belden 9913 will I be able to find the
connectors I need? Grove Enterprises advises to use RG6/U. Can I find
N connectors and BNC connectors for RG6? Is RG59 cable really that bad?
Will I notice the signal loss?
Sorry for all the questions, I'm new to this scanner business. I
bought the 2006 because I have heard it is going to be phased out. I had a
2004 and sold it, stupid mistake.
If anyone is generous enough to answer my questions, please email
the response to me because I do not have subscription access to the
scanner list.

Thanks,

Edward Dotson

I recently bought a Hustler Discone new for $24.95 and it works just as
good as the Radio Shack version. I have heard that the RS discone has
gaps where poor reception can occur on some frequencies. I have not
confirmed this, but the price difference led me to the Hustler Discone!
It works great up to 800+ MHz, and very well in the 49 MHz range also.

While flipping thru the Feb issue of CQ I noticed an ad on the
left hand page from ACE. The have a .500 thru 1300MHZ with no cutouts
scanner for $449. It was called the Tiger something or other. No mention
of SSB but seemed to be comparable to 1000 xlt in brief specs (ie 1000
channels etc.) Anyone know more about this and how did they get away with
advertizing no cut outs when celluar MUST BE BLOCKED!
If the illustration is accurate (?) this has got to be the
thinnest scanner I have ever seen! A true shirt pocket device at last.

>while back. Any satisfied R-1 users out there? I would like to get
>specs similar to the R-1 (continuous coverage from (from memory) 30KHZ
>to 1300 MHZ)

Scanners with specs similar to the R1 are:

AOR AR1000XLT
AOR AR1500 (like above but smaller, wiith SSB)
Yupiteru MVT-7000
Yupiteru MVT-7100 (like 700 but with SSB and more memories)

The AOR models are distributed by several mail order companies here. They have a difficult user interface because they work outside of the Uniden/GRE licenses. They have uneven quality control; sometimes you have to exchange 'em.

The Yupiteru models are much better in interface and quality; however they have no US distributor or warrantor. For months many of us have been buying the MVT-7100, which is probably the most capable handeld ever produced, from a British dealer called Javiation.

AOR will be introducing the AR8000 handheld this spring/summer/fall; it is designed to compete with the MVT-7100, but there aren't even production samples available yet. When it hits the US you cna be sure cellular will be unrestorable.

I have online reviews of the AR1500 and MVT-7100 if you're interested.

regards -- mike

1217. Antenna Problems with 8500XLT.

Newsgroup: rec.radio.scanner
Date: 1994-02-20 13:57:32 UTC
From: jm39s70@sycom.mi.org
Message-ID: <jm39s70.4hbm@sycom.mi.org>
Source record: 276875
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.scanner

Hello,

Still enjoying my 8500XLT, BUT, I am having a weird antenna problem. I have a RS Discone antenna in my attic and it was connected to my 800XLT through seeveral 25' runs of RS cable connected together with barrels. This worked great on the 800XLT, but when I connect it to my 2500XLT it acts like there is no antenna on it at all. A friend has suggested that since the 2500XLT is grounded (and the 800XLT is not.) there may a short to ground. I intend on checking the cable for any shorts between the conductor and shield as soon as I get my VOM back but does anyone have any hints/suggested/tips/wild-ass-guesses that I can use so I can get the discone on the 8500 and see what this thing can really do! Thanks in advance....

I have been using a PRO-34 scanner for several years now. Recently, I have
been having some trouble with the charging system for its rechargeable
batteries. Some of the batteries run down very quickly while others hold
their charge. The batteries can all be recharged in a seperate recharger, but
not in the radio's internal recharger. The battery holder sometimes becomes
corroded. Do you think this problem is the fault of the holder, the radio,
the charger, or the batteries?

How? Part 97 basically says that the FAA regs must be obeyed. If he used a radio aboard an aircraft with the operator's permission, he was in compliance with the FARs and thus with the FCC rules as well.

I use about 25ft of low-loss RG8 with PL259 at both ends; the side next
to the Pro2006 also has a SO239 (female PL259) adapted to a male BNC
that plugs right in.

I do it this way because the PL259 is more compatible with other amateur
equipment. Using 9913 and or type N connectors is really not important
for receive only unless you really deal only with low-signal high UHF
material.

Do stay away from the RG58 unless the run is very very short <2 ft.
It is very lossy for VHF/UHF work.

1225. Computer control variances: AR3000 vs AR3000A

Newsgroup: rec.radio.scanner
Date: 1994-02-20 19:28:24 UTC
From: mjr@crl.com
Message-ID: <2k8dko$erm@crl2.crl.com>
Source record: 276883

Sam Dunham has a program called ScanStar that performs computer control functions for the AOR AR3000 series scanners. Now I understand from Sam that the program works fine on the AR3000, but not so well on the AR3000A. For some reason, on the later model, the program behaves as though some control signals were missing or to be found on a different pin, even though the AR3000A port control documentation indicates the communications program should be set for SOFTWARE flow control (X-on/X-off). I've spoken to Sam and he apparantly called ACE to ask about this, but when they realized who he was (and that he was competing with their software) they wouldn't tell him anything.

As I see it, there are three possibilities:

1) some difference in the port hardware configuration.
2) some difference in the processor micro-code involved in controlling the port.
3) a bug in the AR3000A port microcode that requires an undocumented work around.

Is there anyone out here on the net who knows what differences there are between the two units that might explain this problem?

Help much appreciated as usual
Thank you

I have found that fireground usually means the actual scene of the fire.

This is different from the dispatching frequency(ies) so that even during a fire, communication at the fire scene continues without interfering with dispatching to other situations.

Here's a collection of all the mods I know of, other than the AM/FM
switch. I posted this a number of months ago, so some other better ways
might have come up, but I think these all should still work. Here Goes:

Okay, all. In response to this, I'll go ahead and post the mods I know of
for the 100XLT. These have been collected from other netters, and some of
this is discussion via e-mail with others.

Uniden America Corporation
8707 North By Northeast Blvd.
P.O. Box 501368
Indianapolis, IN 46250
Attn: Parts Department

Here's the info on current mods I've gathered:

Here's some information about the BC100XLT collected from posts and
correspondence with people more familiar with the BC200XLT.

From mailed notes:

------------------<BEGIN LETTER FROM BRETT BOROWSKI>-----------------

Yup, it's the same CPU. And I suspect that most of the pc board inside
are the
same. The 100 will not have the 800mhz sub-pc board, an extra memory chip,
and will have some jumping blocks in different places than on 200. I'll
get back to you with the light mod.....

This also looks the same.
>
> So how similar are the guts of the 200? Could it be that Uniden only left
> out one board which could just be soldered in place?

The guts do appear to be the same. As far as the 800mhz, unit, there are 5 inductors and 2 caps on one side. But 15 caps, 10 resistors, and 4 transistors on the other side. It does not look simple to build on your own. I'm under the impression that the performance of this board is critical. My current scanner measured in at 0.5 microvolts of sensitivity in the 800mhz region but the previous one measured about 2. That's a pretty wide range for a single model of scanner.

It might not be so hard to add some memory though. One chip and moving a jumper as far as I can tell....

> Let me know what you figure out as to if anything looks the same or might
> be moddable as you posted in you messages about pins 15, 18, and 19, and
> also the light mod. One final question: how do you count the pins?
> I have noted the beveled edge on the largest IC's, but don't know how
> to count the pins.

Okay, on the CPU (UC-1147), number one is the first pin to the right of the notch. Number 64 is to the left of the notch. (ie, they go counter-clockwise.)

To turn the light on, jump the transistor input that is fed by pin 63 (2nd from the bottom on the left edge--notch to the lower right) to VCC. Pin 26 is VCC and you should be able to trace it to a clear pad near the bottom edge of the board (when you can read the text on the CPU). This pad is the alternate location for a jumper chip that should change the low band form 29-54 to 66-88mhz. (Note, I don't know if all the inductors and adjustments are the same in the European version which employs this configuration.) Well, about those light pins--pins 60-62 are also VCC. So if you want the light on all the time, just tie 63 to the pin or pins above it. You can do this with one find strand of a braided wire and no soldering if you're carely. But your light will be on whenever the power is on. If you want to add a switch, solder the leads--one to that VCC jumper block pad I mentioned, and the other to the transistor that pin 63 leads to. I don't recommend soldering directly to the CPU--it's more likely to be heat sensitive and those pins are pretty small.

I hope I haven't confused you. Any more questions, just ask!

Brett

brett@surfpix.princeton.edu Brett Borowski

------------------<END LETTER FROM BRETT BOROWSKI>--------------------

Quoted text inside above letter quote is mine (along with drawings), while unquoted sections are his replies.

On first diagram above, the chip labeled 400 EC is the frequency crystal. It operates at 400 KHz, and recently Tom Bodoh (bodoh@dgg.cr.usgs.gov) posted that he had plenty of extra crystals to sell which double the clock frequency to 800 KHz. I did this mod, and am pleased with the faster performance. Now it scans 40 Ch./sec., samples priority twice as often, delay time is cut in half, and light on time is also twice as

short. However, if, like me, you do the light mod and put in a switch, you won't have to worry about the light part.

UNIDEN refused when I talked directly with them to sell the 800 MHz board. They will sell all the parts minus the PCB itself: I am currently working on getting around that, and will post any progress. But that seems to be the only real difference between the 100 and 200, again other than memory and moving a jumper (as desribed by Brett). So I had thought about building my own board, and that's what my letter to him was partially about. After all, it couldn't cost UNIDEN but $15 for the memory chip, and who knows how much for the the extra board, but how much more do they sell the 200 for? I figure they're running about 200% profit on the 200 over the 100. That's probably why they are so hesitant to sell the board: because they would lose lots of profit. They don't even sell this board to the dealers: _all_ repair work on the units has to be done in the original factory. If I could get my hands on a schematic and circuit board layout, though, I will probably try to build one myself. If I ever get one, I may post info in the newsgroup, as I have seen many requests for mods to the 100. So even though it dosn't seem like there are too many 100 owners out there, there _are_ some, and I'm sure we'd all like a little better.

Notes on opening the unit : Remove the back two black screws, obviously: next pull off battery pack and undo the two screws holding in battery spring in middle of bottom. Then lift back end of bottom of radio up slowly, pulling out a little at the same time. it should slide out without too much trouble. Front cover is more problematic: it has a header connecting the keyboard with the CPU etc. board. So lift up on the bottom of the front slowly, and look inside as soon as possible for a small black rectangular box about .25" by .75", and continue lifting slowly while watching that you don't bend the pins. After that, the board with the metal shielding around it comes up with two screws at the bottom of the radio. Reassembly is reverse order, obviously. Again, caution when putting front back on so that you first insert top of front back under lip at top of radio, then make sure to get all the pins in the header correctly. After the first scary time of doing it, you'll see how easy it is, and it should go faster. Always remember the pins on the header will bend pretty easily, though, and that's about all the difficulties.

Hope this helps, but don't fry your radio. Be careful about static electricity while working inside the radio, too.

--Sherrod

From a post on the internet regarding the internals of the 200XLT, which is the fully enabled version of the 100XLT:
----------<BEGIN SECOND QUOTE>----------

There are three pins on the CPU that are jumped to ground. (15, 18, and 19) They are not labelled in the service manual. The interesting thing about these pins is that there are alternate pads on the pc board that

could jump each of these pins to VCC instead.

Being the foolhardy soul they I am, I moved each of the little jumping
blocks to find out what would happen. The results are mildy interesting
and not overwhelmingly useful. I was hoping I could get 30khz spacing
in the 800mhz range, but no such luck. Two of the three reduce the
capabilities of the scanner and the third changes it. Here's what happened.

Pin 19--when grounded, allows the CPU to tune 800mhz freqs. When high,
nada. This may be used in the BC100.
Pin 18--when grounded, low band reception is 29-54mhz. When high,
it's 66-88mhz. I think this is for European markets. Sadly,
one can't tune 29-54mhz when 66-88 in enabled.
Pin 15--when grounded, gives 10 banks of 20 channels. When high, the
memory is screwy. In bank 1, you get 1-10. It skips bank 2 and
in bank 3, you get 21-30, bank 4, 31-40, ... bank 10, 91-100.
Leaving you wiht 90 channels. I would have expected 100 channels
with 10 in each. Elminated one memory chip and this could be used
in a bc100. I don't understand the 90 channels, though.

Hope somebody out there find this interesting. BTW, I'm going to
be working on an edited version of 200 mod file and I will add the light
mod. If there's demand, I'll post. If not, I'll post that it's available
and email on request.
Brett
--
brett@surfpix.princeton.edu Brett Borowski

-------------------------<END SECOND QUOTE>-----------------------
The above pins are exactly the same on the 100XLT, as they have
the same circuitry internally, minus a few critical components.

One final note: I have not yet gotten the memory chip and put it in, as I
just got the order number, etc. yesterday. But I think I'm going to go
ahead and get one chip tomorrow and try it myself. I'll be posting how it
goes in a couple weeks (allowing for USPS delays). BTW, if someone could
clip out the diagram above and show me exactly the orientation of their
additional K1013 chip in their 200XLT model, it would save me some time
for getting it from the manuals.

Hopefully this is pretty much self-exlanatory. Any further
questions, get back to me or the original posters and we'll do our
best to help.

IFR means Instrument Flight Rules, and is completely distinct from IMC
which means Instrument Flight Conditions. You must be an IFR flight to
legally operate in IMC, but just because you're not in IMC doesn't mean
you're not operating under IFR.

The FARs explictly state that unless the radio has been approved byt
the aircraft's operator (not pilot), the use of the radio is prohibited.
Some airlines have chosen to allow scanners, some have not. I seriously
doubt any of the airlines have chosen to allow transmitters to be operated
in-flight.

This question comes up often enough that the following might be useful reading again. I snarfed it from the net last year and just distributed it to a kind of mini-list dealing with scanners. Hope it provides soime useful info to everyone. It covers NiCads and the supposed "memory" effect and manages to cover to hints about charging as well. The original articles came from sci.electronics...

OK, someone should do this, so here goes my first draft attempt at a NICAD charging/discharging FAQ. Any additions or comments via email please to cut down on bandwidth.

Most of this is verified or validated or inspired by what might be considered the definitive work:

Rechargeable Batteries Application Handbook
by Technical Marketing Staff, of Gates Energy Products, Inc.
Butterworth Heineman, 1992.
ISBN 0-7506-9227-0 (note -- correct ISBN, incorrect one is listed inside book, correct one on back cover, per Butterworth Heineman)
$49.95 from
Butterworth Heineman
80 Montvale Avenue
Stoneham, MA 02180-2422
1-617-438-8464 voice
1-617-438-1479 fax

Other suggestions for sources of information welcome.

What is not supported by the above comes from various posts here and other memories.

A. Overcharge Effect or Voltage depression (also incorrectly refered to as memory effect).

1. The _real_ memory effect is caused by repeatedly discharging to _exactly_ (or close to) the same point in the discharge cycle, and has been eliminated.

2. "Cells exposed to overcharge for extended periods of time, _particularly_ at elevated cell temperatures, may also exhibit a phenomenon called voltage depression. This results in the cell voltage being depressed approximately 150 mV below the normally calulated values..." (emphasis added)

3. "Voltage depression initially appears on the discharge curve near the end of the discharge. With the extension of the overcharge time (non-discharge) of the cell, this depression progresses slowly towards the mid-point and beyond."

4. "Voltage depression is an electrically reversible condition and disappears when the cell is completely discharged and recharged (sometimes refered to as conditioning)."

5. "An end-of-discharge voltage on the _minimum_ cell of, for example, 75 per cent of its MPV or less will accomplish that restoration with each discharge." (MPV -- mid-point voltage, where 50% of charge is withdrawn, typically 1.20 volts)

6. This is, by my calculation, .90 volts.

B. Cell Reversal

1. Due to imbalance of the various cells in a series connected battery, one cell may be driven into a reversed voltage before the other cells are completely depleted of charge.

2. This effect _only_ occurs in batteries, not in single cells, and is more likely to occur as the battery becomes higher volatge, ie -- contains more cells.

3. Ignoring this effect causes (personal experience) shorted cells, cells with short shelf life (one cell I was trying to rejuvenate on the bench had a 3 hour rather warm shelf life, but did seem to have full capacity if discharged quickly), and cells which will not take a charge.

4. Shorted cells _may_ be partially recovered by _zapping_ them with a high current attempting to _burn_ away the short. I generally use a current limited supply of about .5 amps, and set the voltage to about 20 volts, charging a capacitor of around 10000 uF or so. The cells rarely have much shelf life after being unshorted though.

5. The book has a formula which leads to these minimum recommended discharge voltages:

Num. of Nominal Minimum
Cells Voltage Voltage

1 1.20 -0.20 (0)

2 2.40 .85

4 4.80 2.95

5 6.00 4

8 9.60 7.15

10 12.00 9.25

12 14.40 11.35

6. "...the damaging effects of cell reversal depend on the cumulative amount (amp-hours magnitude) of capacity in reverse and each reversal may utilize only a fraction of the total tolerance of the cell..."

7. Note that this is below .9 volts per cell until there are ten cells (or a 12 volt nominal battery).

8. So, for any battery up to 12 volt nominal, a minimum discharge voltage of .9 volts per cell should be adequate to recover from the voltage depression state without unduly damaging the battery.

C. How to charge _properly_ and quickly.

1. Not all cells are _designed_ to be quick charged (charged at a rate greater than .1 C where C is capacity in amp-hours).

Type of Maximum Charge
cell recommended Control
rate

Standard .1 C NO

Quick .33 C NO

Fast 1-4 C YES

2. There are several types of charge control. Somewhat in reverse order of desirability (ie--least stress to battery) using a split rate constant current, they are:

a. inflection point cutoff -- the slope of the voltage rise with time starts decreasing after the initial rise. This method requires a backup method.

b. rate-of-voltage change -- designed to detect the rapidly rising voltage as the battery approaches full charge. This method requires a backup method.

c. voltage-decrement cutoff -- detects the voltage drop as the battery passes into the overcharged state. (typically equivalent in stress to a delta Temp. cutoff of 5 - 10 degrees C)

d. incremental or delta Temperature cutoff -- fast charge is terminated when a selected cell (with temperature sensor) reaches a fixed increase from the ambient temperature.

e. temperature cutoff -- fast charge is terminated when a specific temperature is reached. If this setpoint is automatically reset, a very undesirable temperature and chargerate cycling occurs, leaving average charge rate high, and temperature high.

f. fixed time cutoff -- fast charge is terminated after a set period of time. assumes that battery was completely used.

g. other more sophisticated and simple methods also exist, but I suspect these cover most cases at present.

h. backup methods may be any that come later on the charging curve, with the simpliest being the fixed time.

i. some very sophisticated pulse charging techniques attempt to fast charge a battery which is not designed to be fast charged. Reports on these charges seem generally good. Some of these chargers discharge the batteries first, removing any voltage depression.

3. Take notice that the temperature cutoff and fixed time cutoff are particularly susceptable to over charge possibility, particularly temperature cutoff with an automatic reset, which is very cost effective for the

manufacturer. If the battery stays very warm after
being in the charger for long enough to be on standby,
then take it off of charge.

4. A safe trickle charge to _maintain_ the charge on a
fully charged battery is from .02 to .1 times C.

D. Opinions and Conclusions

1. I personally would not trust any nicad battery on long
term standby charge at greater than .1 C, and would be
happier with .05 C if the cells are not Quick Charge
types or better. Warmth is my primary indication of
comfort, if the battery stays too warm, I am
uncomfortable.

2. If the battery is discharged to .75 MPV, it seems that
all types can mostly be safely be quick charged at
least, as long as the charge is terminated when the
cells reach full charge.

3. Temperature seems to be the enemy here.

Subject: Re: Nicad memory effect: Any DEFINITIVE answer?
From: myers@hpfcso.FC.HP.COM (Bob Myers)
Date: Fri, 9 Jul 1993 19:18:29 GMT
Organization: Hewlett-Packard, Fort Collins, CO, USA

re: Conditions required for NiCd memory.

OK.

From General Electric's tech. note regarding memory (posted w/o permission,
and any errors are my own):

"Among the many users of batteries in both the industrial and consumer
sectors, the idea of a memory phenomenon in nickel-cadmium batteries has
been widely misused and understood. The term 'memory' has become a catch-all
'buzzword' that is used to describe a raft of application problems, being most
often confused with simple voltage depression.

To the well informed, however, 'memory' is a term applied to a specific
phenomenon encountered VERY INFREQUENTLY [emphasis mine - RLM] in field
applications. Specifically, the term 'memory' came from an aerospace
nickel-cadmium application in which the cells were repeatedly discharged to
25% of available capacity (plus or minus 1%) by exacting computer control,
then recharged to 100% capacity WITHOUT OVERCHARGE [emphasis in the original].
This long term, repetitive cycle regime, with no provisions for overcharge,
resulted in a loss of capacity beyond the 25% discharge point. Hence the

birth of a "memory" phenomenon, whereby nickel-cadmium batteries purportedly lose capacity if repeatedly discharged to a specific level of capacity.

The 'memory' phenomenon observed in this original aerospace application was eliminated by simply reprogramming the computer to allow for overcharging. [Note that no mention is made of adding an intentional *discharge* to clear the problem - RLM] In fact, 'memory' is always a completely reversible condition; even in those rare cases where 'memory' cannot be avoided, it can easily be erased. Unfortunately, the idea of memory-related loss of capacity has been with us since. Realistically, however, ' memory' cannot exist if any one of the following conditions holds:

A. Batteries achieve full overcharge.
B. Discharge is not exactly the same each cycle - plus or minus 2-3%
C. Discharge is to less than 1.0 volt per cell.

Remember, the existence of any ONE of these conditions eliminates the possibility of 'memory'. GE has not verified true 'memory' in any field application with the single exception of the satellite application noted above. Lack of empirical evidence notwithstanding, 'memory' is still blamed regularly for poor battery performance that is caused by a number of simple, correctable application problems."

[End of quote from GE tech. note]

This note goes on to list the following as the most common causes of application problems wrongly attributed to 'memory':

1. Cutoff voltage too high - basically, since NiCds have such a flat voltage vs. discharge characteristic, using voltage sensing to determine when the battery is nearly empty can be tricky; an improper setting coupled with a slight voltage depression can cause many products to call a battery "dead" even when nearly the full capacity remains usable (albeit at a slightly reduced voltage).

2. High temperature conditions - NiCds suffer under high-temp conditions; such environments reduce both the charge that will be accepted by the cells when charging, and the voltage across the battery when charged (and the latter, of course, ties back into the above problem).

3. Voltage depression due to long-term overcharge - Self-explanatory. NiCds can drop 0.1-0.15 V/cell if exposed to a long-term (i.e., a period of months) overcharge. Such an overcharge is not unheard-of in consumer gear, esp. if the user gets in the habit of leaving the unit in a charger of simplistic design (but which was intended to provide enough current for a relatively rapid charge). As a precaution, I do NOT leave any of my NiCd gear on a charger longer than the recommended time UNLESS the charger is specifically designed for long-term "trickle charging", and explictly identified as such by the manufacturer.

4. There are a number of other possible causes listed in a "miscellaneous" category; these include -

- Operation below 0 deg. C
- High discharge rates (above 5C) in a battery not specifically
designed for such use
- Inadequate charging time or a defective charger
- One or more defective or worn-out cells (NiCds DO have a
finite life; they won't keep charging and discharging
FOREVER no matter how well we baby them.)

To close with one more quote from the GE note:

"To recap, we can say that true 'memory' is exceedingly rare. When we see
poor battery performance attributed to 'memory', it is almost always certain
to be a correctable application problem. Of the...problems noted above,
Voltage Depression is the one most often mistaken for 'memory'.....

This information should dispel many of the myths that exaggerate the idea of
a 'memory' phenomenon."

And THAT is the last I'm gonna say on the subject for quite a while! :-)

Carry - yes.
Use - may be.
Different airlines have different policies when it comes to scanner use while on board the airplane. If the airline allows scanner use, it is allowed in the CRUISE phase of the flight only (generally, NOT the first and last 10 minutes of the flight).

Look in the airlines magazine on the seat back for their policy. Or, ask the captain (Pilot) - he is the ultimate athority.

In any case, PLEASE DON'T USE it in the first 10 and the last 10 minutes of a flight. (There have been known cases of interference to navigation equipment from electronic devices - I think there is a current FAA study going on related to this.)

:
It's legal to carry a handheld scanner anywhere you wish unless
security folks at a location (like a secure government or military
site where you are visiting or calling on someone) say you can't (and
even THAT fact is up for debate. Please no one flame me :-))

If it were NOT legal to carry a scanner on
an airplane then they would post that rule along with the signs
that say "firearms, bombs, not allowed" near the metal detectors.
Well, they don't, so you can bet scanners CARRIED onto a plane
are perfectly legal (unless of course your scanner contains a handful of
C4 and a detonator instead of circuitboards).

Actually OPERATING it at a given location (or on specific frequencies, e.g.,
800Mhz cellular) is another story. Basically, either
use common sense or simply ask if you think there might
be a reason that the people (or officials) around you might prefer
you did not operate your scanner. This of course includes aircraft.

I made the bad decision on an airplane once to sneak a listen to the
control tower during take off regardless of what the flight
attendant told me. She threatened to take the scanner until
the end of the flight, so I got smart real quick and shut it
off, stuck it in my briefcase, and didn't touch it until I was off the plane.
I sat there sheepishly most of the flight for getting my wrist slapped.

Now, I ask either a flight attendant or better yet the 1st. officer
or one of the pilots if it's OK to listen to an "aircraft scanner"
(they seem to understand that verbal description best) when I board.

Some say no problem, some say no way. I was on one flight where they
let me listen during takeoff, in-flight, and landing. Other times
they say no, not at all. I usually find that flight attendants
are more naive about what a scanner is, and get the jitters when they
see a black electronic gizmo with all sorts of buttons on it and react
kneejerk and just say no, maybe out of convenience rather than
checking with one of the pilots. On my last flight (from Denver)
I actually got in a good conversation with a first officer about scanners
during the flight (he passed down the aisle before take off).
And yes, he said it's OK to listen the entire flight.

The reason people worry about this is that there is a valid argument for the
possibility that the relatively small amount of RF energy emitted

from your scanner (all radios do this) still also interfere with the
aircraft's avionics and/or radios and/or navigation sytems (no doubt
causing the plane to go into a flaming spin and hit the ground
full throttle doing Mach 3) :-|

Some people say there is solid proof (anectotal or otherwise), and other
people say it's just hogwash. I myself do not know either way, but
I do the safe thing by asking first, when I board, if they will
let me listen to my scanner.

Hope this helps.

Mike

> Use - may be.
> Different airlines have different policies when it comes to
> scanner use while on board the airplane. If the airline
> allows scanner use, it is allowed in the CRUISE phase
> of the flight only (generally, NOT the first and last 10
> minutes of the flight).

Listen too to the announcements from the captain about altitude and stuff. The prohibition during the non-"cruise" portions of the flight stems from an FAA regulation restricting what can be done when the plane is flying IFR (Instrument Flight Rules) below 10,000 feet.

> Look in the airlines magazine on the seat back for their
> policy. Or, ask the captain (Pilot) - he is the ultimate
> athority.

Correct. According to the FAR (Federal Aviation Regulations), the Pilot-in-Command has ultimate authority to authorize or not any radio equipment on an aircraft.

> In any case, PLEASE DON'T USE it in the first 10 and the
> last 10 minutes of a flight. (There have been known cases
> of interference to navigation equipment from electronic
> devices - I think there is a current FAA study going on
> related to this.)

There is probably current research -- the "documented instances" of interference are inconclusive at best. There is some concern that fly-by-wire aircraft, which use electronic controls (such as the 767, MD-11 and Airbus A-320) _may_ be prone to momentary interruptions in the flight controls from heavy levels of RFI, but I wouldn't think that an average scanner should leak enough RF to make a difference. I placed my scanner next to the antenna of a $20,000 Hewelett Packard spectrum analyzer, and could not find any significant signal leak (All of the spikes I could see were less than 1 dB above the ambient electrical noise level). But, ultimately, the pilot has the final call.

Try boarding either first or last and politely asking the pilot for permission before the flight. Delta specifically allows scanners above 10,000 ft, United and American both had near-heart attacks when I even mentioned the subject. I cannot vouch for other airlines, or individual pilots on these airlines.

/Matthew

^
The terminology seems valid throughout the country. However, if you
are in the USA, your frequency is more likely to be 153.83 MHz.

1246. Radio Shack Pro-51

Newsgroup: rec.radio.scanner

From: David.Stark@p2.f333.n2613.z1.fidonet.org
Message-ID: <762103704.AA02760@rochgte.fidonet.org>
Source record: 276904

> From: cravitma@cps.msu.edu (Matthew B Cravit)
> Organization: Michigan State University

> I just bought a Radio Shack Pro-51 (seems to be a replacement for the
> Pro-43, according to the local R.S. salesdroid), and although I have
> only been playing with it a few hours, I thought I'd post a few
> observations:

Fortunately, your salesdroid seems as [un]knowledgeable as any other. The
PRO-51 makes a poor substitute for the PRO-43.

> * Frequency Range : Covers 29-54, 108-174, 406-512, 806-823.937,
> 851-868.937, 896.112-956 (cellular excluded)

No 220-400 coverage makes it a bad deal for the PRO-43 fan.

Reportedly dual-conversion also, but check your manual to be sure. The
PRO-43 is triple-conversion.

1247. Looking For Operating Instructions for BC210XL

Newsgroup: rec.radio.scanner
Date: 1994-02-22 00:24:15 UTC
From: calderwt@redbaron.wosc.osshe.edu
Message-ID: <calderwt.22.2D6950AF@redbaron.wosc.osshe.edu>
Source record: 276905

I need the operating instructions for the BC210XL scanner. If any know how to run the thing could you drop me a leter. I believe it works but not sure how to run it.

Thanks

1248. AR3000/2515 12Volt Connector

Newsgroup: rec.radio.scanner
Date: 1994-02-22 00:32:49 UTC
From: hl1@soc4.acpub.duke.edu
Message-ID: <2kbjrh$gai@news.duke.edu>
Source record: 276906

The 12 Volt connector on AR3000 and AR2515's is a strange 3 pin deal with the female on the cord and the male on the scanner. The shape is a rectangle with two corners clipped off.

Does anyone know the name of this plug? Is it a Japanese National Standard or a DIN design? Is there another place to purchase a replacement besides ACE?

1249. Southern CA Scanning BBS?

Newsgroup: rec.radio.scanner
Date: 1994-02-22 00:50:01 UTC

1250. Do YOU listen to cordless calls?

Newsgroup: rec.radio.scanner
Date: 1994-02-22 03:44:44 UTC
From: alberg@hudlink.hoboken.nj.us
Message-ID: <s+XatA7MBh107h@hudlink.hoboken.nj.us>
Source record: 276908
Cross-posted to: alt.radio.scanner,rec.radio.scanner

If so, I'd like to hear from you!

I am doing an article about cordless phones and scanner hobbyists who
listen in on them.

If you are a cordless listener, I'm interested in knowing:

WHY you listen to cordless

WHO you listen to - do you listen randomly or target your listening?

Have you ever heard anything shocking or bizarre?

Have you heard sensitive information (ie people giving credit card #s,
travel plans, etc.)?

Did you ever use any of the information you heard?

Do you think that listening to cordless is unethical? If not, why is it
more ethical than tapping a land line?

What kind of scanner do you use?

Did you buy your scanner specifically to listen to calls or is this just
a sideline?

ALL NAMES WILL BE KEPT CONFIDENTIAL!!
Please let me know if I can quote you (with a pseudonym).

Many thanks!

Frankly, I wasn't trying to get cordless calls when I bought my scanner. I was more interested in train scheduling and local police. When I couldn't get the railroad yards clearly enough, I went down and bought an external antenna. The instructions were very clear: they talked about snipping off 2" of antenna for 46Mhz, 3" for 48Mhz, etc. I was interested in 400 Mhz and thought "What's down at that frequency that these very exact charts are concerned about?" I didn't alter the antenna, but when I got

it installed I found the cordless phone range. That didn't come in at all with the rubber duck antenna.

I listened one night to Ken and Marilyn. Ken's in jail and Marilyn's been holding down the household for the last several years. Through all of this it was clear that their love for each other endures. Ken's going to be out soon. And they talked about buying a Mercury Sable soon after he's free. Although, Marilyn liked the new Chrysler Neon because of the "cute round headlights."

Complex lives, complex problems, simple solutions. I realized that I should not be listening to such things and just deleted the frequencies from my PRO-43.

People know when they are on a cellular phone that their voices are "on the air" over long distances. But, with a cordless phone people just don't think that the signal travels further than the 50ft between the handset and the receiver.

The other thing that I found with the antenna that I couldn't get before are "baby monitoring" frequencies. Essentially, people are putting eavesdropping devices in their homes. The monitor, often attached to a crib or bed, picks up dialog and sounds throughtout the house. Further, the things are never turned off. It's easy, if you can identify where the monitor is located (usually by a call to a local pizza delivery service) when the family is home and when it's not.

Technology is there to scramble the signals ... it would probably add $10 to the price of a phone or monitor. I'll never get another one of these things until they come with more security.

yesterday as I was driving up the macdonalds driver thru, I turned on
my pro-43 and was enabling/disabling banks to monitor the wireless mikes,
all of a sudden, the scanner froze (no scanning), I turned it off and
turned it back on again, nothing no display. I took the batteries out,
put it back in again, still no display.

so I did the reset, and everything was back to normal (everything except
the 200 channels that I programmed). I was trying to recreate what
I did but could not.

has anybody here experienced this ? btw, I had the priority scan turned
on when that happened.

Fireground is where you'll hear the on-scene operations. Most smaller
departments use simplex, but larger cities, such as Boston, have
repeaterized fireground frequencies. Boston's FD command post vehicle
even has it's own repeater for improved coverage at the scene.

Be advised: voices you hear on the fireground channel are often muffled.
Why? Ever try to talk through the facepiece of an air pak? :-)

When nothing else is on the scanner, I tune in. Hell, I even
listen to the McDonalds headset frequency when the scanner is
really inactive. Call it curiousity. I'm an amateur radio operator.
It's my nature!

>WHO you listen to - do you listen randomly or target your listening?
>
Oh, it's random. Save for this one couple who has some real interesting
arguements. It's quite amusing. I thought only soap operas were
like that!
>Have you ever heard anything shocking or bizarre?
>
Yes. However, Federal law prohibits me from revealing what I've heard.

>Have you heard sensitive information (ie people giving credit card #s,
>travel plans, etc.)?
>
Yep. Again, can't speak about it. But, I couldn't care less about

>Did you ever use any of the information you heard?
>
See previous responses on it being illegal.

>Do you think that listening to cordless is unethical? If not, why is it
>more ethical than tapping a land line?
>
These are radio waves. The electromagnetic spectrum is not
under the 'ownership' of any person, or any government. Listening in to
these is no less ethical than listening to police frequencies.
On police bands, they tell names, addresses, birthdates of people
when they have dispatch run them through the computer. That's more personal
than Joe ordering a pizza. A cordless phone is a radio, and the base
unit is the ONLY 'phone' portion of the telephone. The rest is just
a low-power radio.

>What kind of scanner do you use?
>
Realistic Pro-2010.

>Did you buy your scanner specifically to listen to calls or is this just
>a sideline?
Sideline. I am more interested in amateur radio repeaters and police bands.

>Please let me know if I can quote you (with a pseudonym).
>
Hell, use my name. I don't care. I'm not the one doing 'naughty' things
and talking 'bout them on the cordless phone. I've nothing to hide.

The IF is most likely 10.7 but could be 10.8 Listening to aircraft images won't work that well since your scanner is set to NFM mode while aircraft are on AM mode. To find the image, double the IF and add it to the freq. you want to listen to.

Bill Cheeks first scanner mod handbook has some hints on how calls are moved. It says that in a 7-cell plan (cell A, cell B, cell C etc.) calls never switch to the same cell or adjacent cells. For example, if the caller is talking in cell C, it will not switch to another cell C or cell B nor cell D. So if you have a list of freqs by cell, you have eliminated 3 of the 7 possible cells. Its not much help since that still leaves a lot of frequencies to search. I don't know how things work in the 21 cell plan. The above also assumes a "sectored" cell site which use short range directional antennas (at the base) rather than the omni antennas used in the non-sectored areas. Most cities use a sectored 7 cell format. Many rural areas use the non-sectored format.

Another problem with Bill's explanation is that a call might switch to another cell and quickly switch back to the original cell after finding the signal was too weak.

Sorry about the rambling. Hope this makes some sense.

>onto a commercial airplane?
>

Yes it is legal, but the law is not the problem in most cases. Each airport has its own security people (the guys at the x-ray machines). They have the power to do and say what they want. Of course there are federal rules and guidelines but if they don't like something you have, they have the power to make you check it.

I flew to Canada once with a scanner in my carry-on but on the return trip they said I couldn't take it on the plane. I had to check it!

450.5375

ESPN 450.250 471.950
450.350 462.575
462.550 462.625
464.500 467.325
467.250 152.960
466.650 151.775
461.3125 450.450
450.050 492.887
462.650

Winston Cup Scene 468.650 465.9625

Inside Winston Cup 463.2625

Note: If whoever is covering the race is not on the above frequencies,
try using the search function on your scanner between 450.00 and 470.00
at air time.

Frequencies in the 450-470 MHz range are usually paired in the
following way:

o channels between 450-455 MHz are paired with channels 5 MHz
higher (455-460 MHz).

o channels between 460-465 MHz are paired with channels 5 MHz
higher (465-470 MHz).

To save on space, only one half of the frequency pair is listed.
So, if a station is listed on 461.300 MHz, try listening on
466.300 MHz also.

From: robert@unbsj.ca (Robert Ford)

The following is a copy of a frequency list sold at the NASCAR race
this past week in New Hamshire (I think that is where it was; my sister
and brother-in-law attended and borrowed my scanner.)

I have no idea of the validity of the list for the race since I wasn't there
and suspect most of the frequencies will change by the next race. But,
here goes anyways.

Winston Cup Series

Well, in none of these frequencies are in use when you need them, there
are clearly two places to use your search feature:

1) 460-470
2) 850-856

This should uncover just about anything you are looking for.

Any opinions on the different computer controller add-ons for the PRO-2006?

The two I've seen advertised are the Datametrics communications manager,
and the COMMtronics Engineering HB-232 scanner/computer interface.

Good.
Bad.
Forget the whole thing and buy a new scanner that includes a computer
interface :-).

You'll find strange phenomenon such as this with just about anything bought at
Radio Shack. Generally RS sells other company's equipment after models have
been discontinued or replaced with better models.

ah301@yfn.ysu.edu (Jerry Sy) reported:
> ... was enabling/disabling banks ... the scanner froze (no scanning) ...

You've discovered a small but nasty bug in the PRO-43. Ordinarily you cannot lockout all channels in a bank, but in Programming mode this can happen. If the fully locked-out bank is the only one enabled for scan, the PRO-43 will seize up when you try to scan (or if you turn it off and back on again). The only cure is a complete reset ([clear] [0] and power on), which erases all programming.
To avoid this in the future, don't lock out the last channel while programming a bank, or make sure another bank is also enabled for scanning.

It sounds like you hit the infamous point of having locked out
all the channels on a bank. This is a no-no. It requires that
you reset the scanner to bring it back to life. I don't know
the exact symptoms but I do know you aren't supposed to do this.

1289. Pro 43 Charging System Question

Newsgroup: rec.radio.scanner
Date: 1994-02-23 15:58:04 UTC
From: weisen@alw.nih.gov
Message-ID: <1994Feb23.155804.2055@alw.nih.gov>
Source record: 276846

Does anyone have any info on the Pro 43's charging system (above and beyond what the manual states)? The manual mentions that even a power supply rated for 300 mA max and 9V could damage either the radio or batteries. While this sounds like the usual disclaimer b.s., does anyone know the mechanism for damage against which they are guarding? Also, does the 43 have a trickle-charge system, or should I keep the power converter plugged into the "power" jack when the batteries are fully charged and only use the "charge" jack while charging?

Long live my '43 (and yours).

Regards,
Neil

1290. Birdies-Pro43 Diodes-QUESTIONS

Newsgroup: rec.radio.scanner
Date: 1994-02-23 16:27:10 UTC
From: bbb@kuhub.cc.ukans.edu
Message-ID: <1994Feb23.102710.59309@kuhub.cc.ukans.edu>
Source record: 276847

A couple of questions. As a newbie, I'm curious about these
'Birdies' frequencies. My Pro-43 lists all kinds of these
frequencies as possible 'problem-spots' and sure enough they are.
Are these freqs a result of the particular IF/Synth freqs used by
this radio, or some set of magic frequencies that everyone,
no matter what radio will have problems with.

The second question concerns the Pro-43 diodes D1-D5.
I know that D4 w/diode locks out the cell band, and D3 with a diode
opens up 55-88. So what do D1, D2 and D5 do? D1 and D2 have a diode
(I think) and D5 doesn't Does anyone know what happens if these
are removed/added as the case may be?

Thanks
BB

E-Mail Welcomed.

Not in the case of the PRO-43 - GRE does not market scanners. The problem may have to do with a glitch in the PRO43 microcode which under the right conditions, allows you to lock out all channels. When this happens, all you can do is reset.

Dana, the Pro 43 and 2006 are designed from scratch exclusively for
Radio Shack and are amoung the best scanners there are. I worked for
R/S twenty years ago and I know they have only improved their scanners
tremendously. They now offer private labled Uniden scanners which are
NOT discontinued items, only relabled. You should investigate more
thoroughly before you repeat the usual "Ripoff Shack" slander one more time.

Yes, I know all of their products are not "stellar", but the top of
the line desk and handheld scanners are a wonderful exception.

Jim

Random, but I usually stop on anyone yelling. Used to target when I first got into it. I first stumbled across his baby monitor... thought the Feds bugged his house. C'mon, I was a kid!

|> Have you ever heard anything shocking or bizarre?

No. I don't live near shocking and bizarre people.

|> Have you heard sensitive information (ie people giving credit card #s,
|> travel plans, etc.)?

Travel plans yes. Heard one young lady whine about a particular length layover at a particular airport to the ticket person. Oh, the humanity.

|> Did you ever use any of the information you heard?

That'll be a negative.

|> Do you think that listening to cordless is unethical? If not, why is it
|> more ethical than tapping a land line?

Yes. You'll find a million radio people talk and talk about "radio waves coming into my house". I don't think it should be illegal, but there's a total loss of respect with this.

|> What kind of scanner do you use?

Pro34, Pro2025, Pro2005

|> Did you buy your scanner specifically to listen to calls or is this just
|> a sideline?

Sideline. Bought the 34 for more channels, the 2025 to mount to my dash (calls don't last too long on the road), and got the 2005 for triple conversion and increased sensitivity.. NYPD Shmoo gets smashed on by pagers in double conversion radios.

|> ALL NAMES WILL BE KEPT CONFIDENTIAL!!

Not if more people follow up publicly!

|> Please let me know if I can quote you (with a pseudonym).

Sure, if I get to choose the name :-).

|> Many thanks!

Ja velcome.

|> Somewhere around 30mhz. Try scanning 25-40mhz.

35.02 and, I think, 154.600. If you've got a relatively deaf scanner, you better do it in the parking lot! I hear the one by my house a few seconds before I can see it until shortly before it disappears from my rear view mirror. It's fun to leave it in and see how many you hear from one place to another.

They're like rats in London.

|> My apologies if I don't undertand your type of news feed.

There are lots of subnets out there that receive news feeds. Not everyone is on a T1 or T3. I for one, also read NNTP at home via a FidoNet BBS. They move Internet email and NNTP news once a _day_. I read my mail with what is called an offline reader. The BBS keeps NNTP news .zipped and my Inet email in standard ascii. When I call with my 57.6 modem, I go to a special section for people like me. It unarchives the newsgroups that I have specified as wanting to read as well as my personal mail, bundles them all together in one file, .zips that up, and downloads it. Since it's ZMODEM, I don't even have to touch the keyboard to start the transfer! Then, a mail program on my PC knows what files to expect in this new .zip file and how to handle them. If I wasn't getting 2600cps throughput, or had to pay for the service or the call, I'd be pretty upset too.

I for one never respected FidoNet until recently. It's a keeper.

|> they call it a fireground channel... Fighting fire is indeed a battle...

Most of the time, I find responding units give a "we're responding" call on
the dispatch frequency, followed shortly by "switching to 2". With NYFD,
I've often heard engines and tower ladders talking to each other on the
Fireground freqs as they pass my building well before they get to the scene.

I had a 14th floor apartment here in Manhattan over the summer, and when
scaffolding broke loose and was dangling by one rope off the 15th floor across
the street from me, you can rest assured, I wasn't going back to sleep until
I found the fireground freq!

Is there a mod to enable the Uniden BC-450A 800 band? The 450A is button
for button exactly the same as a more expensive model with the 800 band.

I guess they never saw me when I had a bunch of people around me on a taxiway waiting for takeoff when a plane had to abort takeoff and evacuate the passengers because fuel was pouring out of one of the wings. That was good listening... and watching!

|> (no doubt
|> causing the plane to go into a flaming spin and hit the ground
|> full throttle doing Mach 3) :-|

My thoughts exactly. If they can't correct for a few degrees per hundred miles, then I'd rather fly with my friend who graduated Riddle Daytona two years ago. I don't see a 727 going into a graveyard spin.

|> I do the safe thing by asking first, when I board, if they will
|> let me listen to my scanner.

Haven't had a working portable since then to make it an issue.

|> repeaterized fireground frequencies.

Ah, UseNet.. where we use vague qualifiers like sometimes and often..

NYFD is still simplex. Can you imagine how many repeaters would be needed
to cover thirty or more active fire scenes throughout the city! Now, fire
crews are handed radios that are part of a repeaterized system in specialized
places like the Jacob Javitz Convention Center and Grand Central Station.
Same goes for Subway fires. That's just for propogation purposes. The
signals rarely leave the fire scene.

> BLUE (Mobile) 42.180
> Air-Ground 45.020

Interesting that 45.020 is used for Air-Ground ops in Cali, Ohio often uses this freq (OSP channel F-3) among others.

Related to that, last summer (I think) I was scanning OSP channels in a rural area with a wimpy telescoping whip on a 2006. I was picking up strange traffic on the OSP channels coming in very strong. Eventually figured out they were coming from CHiPs in Southern Cal. Amazing clarity, considering the setup (inside a house) I had.

OK, this one is weird, i own a very old radio shack scanner, the model number i do not know. Now I also work for Ambulance crew and one day i had my scanner and radio on in my room and it was as if they shared a freq. Eveything the scanner picked up, was picked up on the portable and everything the portable picked up, was on the scanner, even if it was on a different channel. Any suggestions as to why this occurred>? I am at somewhat of a loss.

This reminds of a friend who heard me listening to cordless phones. When she inquired how I did it, I explained how easy it was done, and how much reception range I have. She got kinda nervous, since she talks almost solely on a cordless phone, and asked if I could hear her calls. I was SO tempted to say that I probably could, but I was honest and said I couldn't (she lives to far away). Though driving to her neighborhood and listening might prove quite interesting..... *grin*

I am fully aware of the above bug.

I think I mentioned in my original post that I was enabling and disabling banks, NOT locking out INDIVIDUAL CHANNELS. I did not have any channels locked out.

any other ideas ?

1311. Help with Uniden Bearcat BC100XLT

hey everyone,

I just got my MVT-7100 thanks to everyone that put me in that
direction it is so much better than the AOR-1500..

Anyways, The reason why Im posting this is that I have an Idea. WOW

I want to make a small book (probably in PS format) to post here particularly
for the owners of scanners like MVT-7100, AOR-1500, Icom-R1.

I want to put all kinds of freq info into it:
heres what I have so far:

1. General band info 100khz 1.4giga
2. Cell phone freqs (does anyone know the freqs for the 842ch system?)
3. Cordless Phone freqs (and the new channels)
4. general fastfood scanning ie 28-36 Mhz 154-157, 460's

I would like to put a brief list of shortwave freqs as well

Is there anything else anyone would want???

Please email any freq that you would like to see in there
Please NO area specific Freqs just general info...

By the way I plan to make 6 or 8 book pages on one 8-1/2 x 11
to give you an Idea of the size... Pocket.

Any Ideas would be appreciated I hope to have Version 1.0 done by next week.

> after April 94?

I'd bet Radio Shack is. They did when the old TRS-80 model I was
outlawed due to excessive emissions.

> Any idea of how high prices will go after April 94?

As high as the market will bear. I'd guess 150%, if you can find them.

> Any idea how hard it will be to modify these radios?

They will probably use the same chip set, but do the strapping internal
to the chip. You may be able to purchase an chip strapped for overseas
market that will pickup cellular, but other things won't be right.

1318. Cellular Ripoff (Re:call forwarding)

Newsgroup: rec.radio.scanner
Date: 1994-02-23 23:40:48 UTC
From: camter28@astro.ocis.temple.edu
Message-ID: <2kgpi0$b0m@cronkite.ocis.temple.edu>
Source record: 276776

I saw some articles posted here awhile ago about call forwarding
on a cellular phone. At least I think I saw them here.

Wonderful idea, right? I call the company on my car phone, *611
which is free here in philadelphia. And they tell me that call
forwarding is free. Everyone has it and it comes with no extra charge.
Cool! I have a car phone number that will forward my fone calls

Now, my home phone to my car phone is a local call. My car phone
to my Girlfriends house is a local call. My Home fone to my Girlfriends
house is NOT covered under my local calling plan. (Unlimited Local/Metro-
politan Calling) So, I forward my car phone to her house and then call
my car phone.
Little do I know but I get my car phone bill.

(A Lawsuit is in order) My carphone bill was charged 39cents per minute
for every minute that a forwarded call was picked up. Now How can this be?
I am getting charged airtime when there is no "air" being used!
I'm REally REALLLY Irate about the whole thing. Needless to say that I
talked over 3 hours one night. My carphone bill looks like the national
debt.
I called them back up and told them my problem. If I learned one thing
from my mother. (hate to say these things, but she was right) I was nice.
I didn't yell, curse,scream or anything and they kindly removed the charges
for the forwarded calls. Now, would someone please explain to me
why a cellular company has to charge airtime on a forwarded call when
there is absolutely no air being used?
They tried to give me the crap about the call is being routed through
the cellular system, but I don't believe that. The call is being routed
from MA Bell to them, to which the call is then forwarded to it's destination
by MA BELL. Why dosen't Ma bell charge 36 cents a minute for a forwarded
call?

By the way, I'm specifically not mentioning the carrier in the
letter. If someone wants to know the carrier, then I will tell them
specifically.

Moral: Don't believe anything someone tells you that sends you a bill
for 30 days later.
#2 - being nice saved me from a hunk of trouble. Thanks mom!

questions? comments? I would like to hear from you!
Thanks..

-*>Is this a significant drawback? What would I be missing? How does the
-*>sensitivity compare between the Pro37 and the 43?. The sound quality?
-*>
I have both and there is a considerable difference in the two
scanners. The Pro-37 is larger and heavier, has an easier to read display,
and has the scan and manual buttons conveniently located on the top if the
scanner.
The pro-43 is smaller lighter, and easier to conceal than the 37, the
display is harder to read. No buttons on top, is selectable am/fm mode, is
less prone to intermod (with some exceptions) is more sensitive, and
performs a lot better on the 800 Mhz police bands (the 37 has cell images
in the middle of all the good PS trunked bands)

Both are pretty easy to modify for uninteruppted 800 Mhz coverage. Any
other questions?

What they will have to do is change the program so that is no longer
checks to see whether X is present, it just locks out cellular always.

The only way to mod these type of scanners will be to change the ROM.
It will simply be easier to use a block converter (or known images).

Source record: 276782
Cross-posted to: alt.radio.scanner,rec.radio.scanner

What's up with the Radio Shack PRO-46 scanner? It doesn't have the govt air freqs that the PRO-43 has, but goes up to 1126 Mhz, as compared to 1000 on the PRO-43 (BTW, what is scannable in 1000-1126 MHz?). But at least one ad (EEB) has the 43 marked as "cellular restorable" while the 46 has no such indication. A couple of people have said things to the effect of "if it covers the 800-900 Mhz range, it's probably restorable," but I wonder if, since it's a fairly new model, perhaps RS has done something to make it impossible to unblock the cellular freqs on their latest models (e.g, the PRO-46, 2027, 2030, and 2032)? The 46 lists at $120 less than the 43 ($70 less with the 43 on sale at $300), but if the blocking can't be removed... %(

From: mulligan@ACM.ORG
Message-ID: <2khfsr$50s@hopper.acm.org>
Source record: 276785

The PRO-43's internal charging circuit consists of a 22 ohm resistor, two filter coils and a forward biased diode. Combine this with about 30 ohms internal resistance in the supplied power cube and you get a max of perhaps 180 mA of charging current into a dead short. Any well-regulated supply with 9v o/p and at least 300 mA capacity should work (note the center conductor is negative).
My non-scientific test with a set of 600 mAh NiCads, discharged to 0.9v per cell, showed an initial charge current of ~90 mA, dropping to 55 mA in the first few minutes. From then on the current gradually decreased to 30 mA after 14 hrs, where the batteries showed an unloaded voltage of 1.25v. You could leave them on charge at this rate (.05C) for the rest of a day, but it probably be a good idea to pull the plug after they're charged.

Superintendent of Documents orders (202) 783-3238
U.S. Government Printing Office
Washington, DC 20402.
The FCC rules and regulations are available as Title 47 of the Code of Federal Regulations (47 CFR). The five volumes cost from $12 to $20 each and are revised annually. Volume 1 (Parts 0 to 19) includes the 90-page Table of Frequency Allocations. Volume 5 (Parts 80 to End) covers the various mobile services. The GPO operates bookstores in major cities. {--- --}

U.S. Department of Commerce orders (703) 487-4600
National Technical Information Service rush (800) 553-NTIS
5285 Port Royal Road Fax (703) 321-8547
Springfield, VA 22161
Supplies the Master Frequency File, subsets and indexes, on microfiche and 9-track magnetic tape. The State Index microfiche is ~$55 and includes frequency, name, city, state, call sign and service code. All the mag tape files cost more than $1000. NTIS has catalog extracts available describing the various FCC files, formats and prices (ask for PR-718-2 and PR-781-1). {Oct 93}

ITS - International Transcription Service (202) 857-3800.
1919 M Street, room 246
Washington, DC. 20554
Government copy contractor providing online access to FCC Data. V.32/V.42bis, 9600 baud @ $100/hr, 2400 @ $50/hr. SQL Access is also available online. Searches can be performed and data downloaded in batch via Kermit. Custom Searches are availble with results on disk, tape, or paper; cost varies by search ($1000.00++)
[Feedback: not for the hobbyist!] {Oct 93}

Grove Enterprises, Inc orders (800) 438-8155
P.O. Box 98 office (704) 837-9200
Brasstown, NC 28902-0098
Offers the index to the Master file for individual states. File comes on HD floppy disk and is dBase compatible. Access program and one state is $39.95 (49.95 for CA, TX or FL) + 3.00 s/h. Updates are $29.95. A nationwide file included with each state order. Also offers a national railroad file for $29.95.
Fields are - freq., name, city, county, state, latitude & longitude, call sign and service code.

[Feedback: established vendor, offering the index files since '91,
updated yearly. Many satisified users.] {Oct 93}

PerCon Corporation (716) 386-6015
CD Applications Division Fax (716) 386-6013
4906 Maple Springs / Ellery Road
Bemus Point, NY 14712
Offers "a full line of FCC related databases" on CDROM and floppy disk.
Available are various subsets by service, state, etc. Formats are ASCII
and dBase compatible (access program provided with the CD-ROM version).
A single state CD-ROM (all frequencies) is currently $99.95.
Fields are - frequency, service code, type code, call sign
licensee: name, mailing address, city, state, zip, expiration date
number of mobiles: vehicle, portable, aircraft, marine, pager
transmitter: lat. & long., city, county, state, elevation,
antenna height, output power, ERP
[Feedback: several satisfied users.] {Feb 93}

CET (800) 445-0297
1001 S. Ridgewood Ave.
Edgewater, FL 32132
Offers a file on floppy of all stations within a 30-mile radius of a
customer-specified location. The prices are: rural $80, metro $140,
super-metro $200 (printed list are one-half these prices). Available in
ASCII columnar and comma-delimited formats. Does not include stations
lacking a specific location (i.e. mobile-only systems).
Fields are similar to those described for PerCon (186 bytes/rec).
[Feedback: some early confusion about prices due to erroneous postings
to the net. Users satisfied otherwise.] {Oct 93}

ScanWare Associates (206) 698-1383
7910 NE Double Hitch Ct Fax (206) 698-8207
Bremerton, WA 98310-3801 BBS (206) 871-4228
Offers its "FCC Frequency Retrieval System, Ver 1.15", a "database
management system for the FCC Master Frequency File ..... includes
program and FCC database for any state". Fields are similar to the
PerCon file (275 bytes/rec). Program is compiled Clipper and data
is dBase compatible. Distributed on HD floppies.
Program & one state, $29.95 (CA, TX, FL or NY, $34.95); add'l
states $15 ea (CA, FL, TX, NY $20 ea); plus $5 s/h.
[no feedback available, but an examination of the promotional Beta
release of Ver 2.0 confirms the file layout.] {Jan 94}

Scanner Master (800) 722-6701
PO Box 428
Newton Highlands, MA 02161
Provides online "access to nearly the entire F.C.C. database and is
updated weekly". Includes all fields in the Master File records. Allows
selective downloading by search criteria and reporting of particular
fields. Charges are $25.00 for a users guide/membership kit and
$1.50 /min (first 10 mins free).

The communication protocol has been changed. The 3000 will send the
current s-meter reading several times a second. If you switch on the
3000A it will send a kind of logon message and a prompt. Then it just
sits there and waits for commands. If you want to get the signal
strength you have to ask for it. Control programs for the 3000 don't
ask and therefore will not work with the 3000A.

> ing can't be removed... %(
--

In the 'older' scanners (pre-1993), the chips allowed entry of celluar band freqs so they could be received. True, on many models, a diode or whatever had to be cut/removed/replaced, BUT the microprocessor STILL had the capability. The diode only was there so the product didn't appear to have celluar capability at the point of sale, for whatever moral and/or financial reasons.

The question is: do the chips in the NEW models have the capability of celluar reception at all? Since these are redesigned models, I would imagine a 'brand-new' chip would be created. It would be easy to 'lock-out' the celluar freqs by not allowing the celluar freqs to be entered/searched via the new program on the chip.

I've heard the 'epoxy on the diode/resistor' method (like on the ham 10m rig HR-2510) may satisfy the new legislation from a tech at radio shop.

>Has anyone modified their PRO-46 to unlock the Cell bands? If so, which diode or diodes
need to be excised?

A friend ran across these and EMail'ed 'em to me... Haven't tried them
because I bought a Pro-43 instead of the Pro-46. Remember, the Pro-46
is made by Uniden I haven't heard too many good things about them...

BTW, I love my Pro-43! :)

Anyway, here are the Pro-46 mods...

--Ed

Here is what I found for the Pro-46 mod - same from 2 different sources:

Pro46.Mod
You will be able to tune continously from 80?whatever to 95?whatever
and this will include the appx 870 - 890 cellular band with the
proper 30 MHz steps for the cellular frequencies.
1.Remove battery pack, battery door and antenna.
2.Remove the 4 black screws on the back of the radio: push upward on bottom at
rear case and cantliever (swing) case half up from bottom to separete and
remove, its not necessary to remove belt clip.
(note: This sounds much easier than it is. Be prepared to "prop and lever"
around 3 catches in the battery case, along with one on each side around

1/4 of the way down the case)
3.Carefully separate RF board from processor board by inserting eyeglass
screwdriver between board by plug-in connector.
4.Unsolder copper-coated plastic Rf shield from microprocessor and set aside.
(note: If memory serves me correctly, this SHOULD be the side where the
pushpad is. In order to follow the rest of the instructions, place the
scanner face down on a piece of cloth or in a clamp with the antenna facing
AWAY from you).
5.Locate two resistors marked "0" (zero) on right side of board.
(note: On mine they were labeled "000", not "0")
6.Carefully unsolder and remove BOTH of the resistors.
7.Reinstall ONE of the removed resistors (or jumper) on the UPPERMOST set of
EMPTY solder pads.
(note: These are located just to the left of where you just removed
the two resistors.)
8.Thats it, reassemble the radio.
PS-Reintstall one of the removed zero marked resistors into top set of empty
solder pads. DO NOT install anything into LOWER SET of empty pads (cancels 30-
50 mhz and adds 68-88 mhz.
- -
The Following modification is intended only to restore contin-
uous 760-1300 MHz coverage as originally provided by the design
of the PRO-46 Microprocessor.
824-851, 869-896 MHz Freq Restoration :
Tools Required: Fine-tipped soldering iron, desoldering wick,
small Phillips screwdriver, small jeweler's type screwdriver,
long-nose pliers, rosin core solder.
(1) Remove the battery pack, battery door and Antenna.
(2) Remove the four black screws from the back of the radio,
then push upward on the bottom of the rear of the case,
carefully swinging it upwards and removing it.
(3) Carefully insert a small (jeweler's) screwdriver between
the two boards next to the interconnect plug in the lower
right coner. Gently pry the top board up to sparate it.
and set it aside.
(4) Unsolder the copper-coated plastic shield from the
microprocessor and set it aside. (CAUTION : Too much
heat will damage the shield).
(5) Locate the two chip jumpers imprinted with "0" ,near the
edge. carefully unsolder and remove both.
Note: they are side-by-side below the microprocessor.
(6) Solder one chip jumper across the two uppermost unsed solder
pads (Closest to microprocessor). Soldering a jumper across
the lower two pads (futhurest down from microprocessor),
changes the 30-50 Mhz low band to 68-88 Mhz for foreign
use. Note : Unused pads are allmost straigth across from
where the jumpers where originally installed.
(7) Reversse steps 1-4; the modification is now complete.

I have the mods for the PRO-46 and tried them, but they did not work.
After the mods were done, the scanner then scanned the cellular freqs.
as normal, but when it encountered audio, it seemed like it muted it.
My guess is the LSI chip (branded Uniden) inside is now masked to mute
the cellular freqs.?
Anybody else try?

Date: 1994-02-24 21:36:31 UTC
From: steve@galaxy.nsc.com
Message-ID: <CLr00v.DDL@voder.nsc.com>
Source record: 276800

Anyone wanting to kill or reduce the Beep tone on the Pro-43 to a more reasonable level while performing other mods can do so in the following manner. Get the other Mod info before starting this operation. After lifting off the second (audio) board, find a large surface-mount resistor under the area on the LM386, maked 471. This is a 470 ohm, 1/4 watt resistor that couples the beep tone straight to the speaker output lead from the uP through a buffer transistor having this resistor as a collector load to the power supply. Unsolder this resistor and replace it with a 2k ohm 1/10 watt surface mount resistor and you will have reduced the volume by the ratio of new to old resistance value. The Beep here was reduced by 12dB. Of course, I will not liable for any damage caused by attempting this rather difficult modification!

> I hope this isn't some problem with my Pro-43....

There is one way to see if it is an image. I see that you are using a PRO-43
to receive these mysterious comms. Borrow a friend's Uniden, AOR, or whatever
and see if it receives these mysterious transmissions. Different models often
receive different images due to different IFs, among other things. If nothing
else, hopefully it will eliminate the possibility that your 43 is on the fritz.

Transmissions like that are a good reason to start a foxhunt for the
transmitter!

: grounded (and the 800XLT is not.) there may a short to ground. I intend on
: checking the cable for any shorts between the conductor and shield as soon as
: I get my VOM back but does anyone have any
: hints/suggested/tips/wild-ass-guesses that I can use so I can get the discone
: on the 8500 and see what this thing can really do! Thanks in advance....

Personally, I would replace the junky Radio Shack coax with some decent stuff.

If you are going to check for shorts, you will have to disconnect the coax
at the radio and the antenna - primarily the antenna. You will get either
a very low or dc short reading - which is normal.

Does it still work ok on the 800XLT? If so, then I suspect there is a problem
with your new radio.

Bill

>
>I have owned both of these scanners,and in my opinion,the 43 is definitely
the way to go,even more so if you are interested in cellular.The 200 does
have SOME advantages.The 200 has MUCH better audio,and a much easier to
read display.800 MHZ reception is much better on the 43,and when you do
the cell mod,searches in the correct 30khz steps.the 200 searches in 12.5khz
steps,ok but hardly optimum.The 43 also mutes the control freqs so it won't
stop all the time and has no birdies in the cellband.As far as doing the cell
mod,the 200 is easier to do,but the 43 isn't all that hard,I've done 17 43's,
and at least 30 200\205's(same radio).I sold my 205 after I got my 43,I can
live with the weak audio.

Cellular Restoration on the Realistic PRO-2022

The Realistic PRO-2022 certainly is a look-alike for the all-time
popular, but now-discontinued, PRO-2005. But is the similarity only
cosmetic? What tricks can be done to increase the utility of the
lower-cost 2022, now availible from Radio Shack and Grove Enterprises?
Of the greatest interest, can cellular phone coverage, censored at the
factory, be restored? Yes.

After removing the two upper back screws and the top lid, locate the
black cable just behind the front panel. Adjacent to the cable are
four diodes locations: D42, D43, D44 and D45.

D42 is not present; installed, it adds the 68-88 MHz
European mid band (which includes the US 76-82 MHz
mid band), removing the US 30-54 MHz low band. Even
if a switch were installed to allow the diode to be
selected, additional components and realignment are
necessary for that higher frequency coverage. Don't
do it!

D43 is present, allowing the 800 MHz band to be received;
the diode may be deleted so that the same microprocessor
may be used in scanner modles which don't have that
800 MHz capability. Don't touch it!

D44 is present, deleting the cellular mobile and base
frequencies. If one lead is cut, total 806-960 frequency
is restored, including 30 kHz steps in the cellular
band. Keep in mind, however, that mobile telephone
eavesdropping is prohibited by the Electronic
Communications Privacy Act!

This modification may void your warrenty; it is best to cut the lead
carefully, gently separating the gap slightly so that it may be resoldered
in case the radio needs warrenty repair later.

D45 is not present; installed, it makes the cellular 30 kHz
increments change to 12.5 kHz. A small SPST switch

connected in series with one lead of a 1N914 or 1N4148
could allow selection of the 25 kHz step interval in
those areas which utilize that channel spacing.

To do this, it is necessary to unsolder a shield under the circuit
board which covers the solder pads for the diodes. Such a modification
should only be attempted by someone familiar with electronic circuitry.

Hi All,

Very last minute this but I wonder if anybody could would be kind
enough to mail some of the main "interesting freq's" for the Miami area -
anything really as I am leaving tomorrow morning and will be stopping
near the airport (Dade County I think ?).

Any info very much appreciated
.

Hi Gary,

If you want to reclaim the VAT element of the purchase price you
need to purchase it from a delaer/outlet who particpates in the
Retail VAT reclamation scheme as the dealer/outlet also has to
comply with the scheme. I am not 100% sure about
how this scheme works.

>can they take my scanner away at customs since this scanner is
>illegal in the US?

With regard to Customs No. It is not illegal in the US for you to bring upto
three non type accepted products into the USA for your own
personal use and not for re-sale. You should complete
a FCC form 740 (but you may not tell anybdy you have it anyway).

After April 26th this year FCC rules will still allow upto three non
approved products to be imported but Federal Law will prohibit
cellular capable scanners. As Federal Law comes before FCC rules
it would be illegal for you to either Import or Hand Carry a
MVT-7100 (Or similar) into the US after April 26th

>
>Where is a good place to pick up the MVT7100 in Cambridge or
>England (and at a good price)?

You could try Lowes in Cambridge or The Shortwave Centre in
Norwich (0603-788281 - ask for Paul) or if you are in/around the
London area there are a good few dealers.

With most chargers, you must charge the high capacity NiCd
cells for a longer period of time than ordinary NiCd cells.
Otherwise, you are not making use of their extra capacity.

I switched to using "whatever is on sale"-brand alkalines in the PRO-43
instead of NiCds.

The Yupiteru costs 399.95 pounds including 17.5% vat from
ASK Electronics Ltd
248 Tottenham Court Road
London W1P 9AD
Tel 071 637 0353

There are a few radio stores on this street with similar prices.
London is about 1 hour by train from Cambridge (about 20 pounds
for a ticket). I've only got the phone number of the store
in Cambridge : 0223 311230.
Hope this helps,

David

1356. BC100 Antenna Mod

Source record: 276726

Get the PRO43. I have both (started with BC200). The BC200 is only double conversion and prone to images. The PRO43 is triple conversion and tends to be cleaner.

The mod for the BC200 is easier but not by much (clip a resistor). The mod for the PRO43 requires removing a surface mount diode but the board is harder to reach.

The cellular mod for the PRO43 steps in the correct 30khz steps, the BC200 steps in 12.5khz steps thus missing quite a few cellular channels.

Sensitivity seems to be about equal. The BC may actually be a little more sensitive, but with more images so there are fewer usable frequencies.

1358. What Base Station Scanner To Buy?

Newsgroup: rec.radio.scanner

Another possible cause is something that happend to a cable I had in the car that I used for an HT. It was a PL259 with a BNC adaptor on it. Since the radio got moved around a lot, and the center conductor was soldered to the center pin, there was nothing holding the outer part of the coax to the connector and the center conductor of the cable broke. I didn't notice it right away because, sometimes, depending on what position the coax was in, the center conductor would make contact.

So try moving the cable around when you make you continuity test with a DMM.

Although I don't specifically remember a 210XLR, my guess is that it is an enhanced version of the BC210XL. I fairly sure it does not have 800MHz. I don't think any freq. mods are available for it either. In general, these scanners are good "background" scanners - good for listening to while reading the paper, or as a second scanner. If you are into scanning or think you will be, This probably isn't the best First scanner to get, unless you just want to dabble to see if you like it.

They could have made the warning voltage a little lower, but the real problem is that ni-cads have a lower voltage than alkaline (1.25 for ni-cads -vs- 1.5 per cell for alkaline).

1364. Further criminalization of scanning

The FBI just announced their new wiretap bill for 1994.

Among its many provisions, monitoring cordless phone
will be criminalized, just like cellular is now.

Presumably the FCC will have to act to ban all scanners
that can tune the 46.xx range... I might suggest you buy those
continuous range scanners NOW before while they still are
permitted to US Citizens.

My third Pro2006 just arrived, as did my fourth ICOM W2A HT.

For more details of the Draft Bill and analysis by Attorney Mike
Godwin of the Electronic Frontier Foundation, check into
comp.org.eff.news and comp.org.eff.talk or send e-mail to
mech@eff.org.

The EFF will be fighting this bill as hard as it can; you
too can join the battle with us...

Well, what do you expect for $10? If it breaks, buy another one!

>but it sure pulls in the Connecticut State Police on 42 MHz...

I'm pretty impressed also. I had pretty much given up on listening to VHF-low on my Uniden BC200. But with the RS whip antenna, VHF-low reception is quite good, so long as the antenna is fully extended.

Interestingly, this antenna also does very well on VHF-high, but you first have to collapse the first segment above the loading coil. My guess is that this shorts out the loading coil.

I once believed that loading coils are mainly to ensure a good impedance match when transmitting and don't have much effect when receiving. But the behavior of this particular antenna seems to contradict that. The loading coil significantly improves reception of VHF-low but hurts VHF-high. Perhaps someone who actually understands antennas can explain.

My experience with the antenna is nearly identical. Reception of Ohio State Patrol 45Mhz transmissions increased in number greatly when I removed the supplied Pro43 duck, and replaced it with the RS Telescoping whip. In my experience, it's given me the best VHF-Lo performance. Doesn't seem to sacrafice much performance, even when fully extended, on the higher frequencies.

You could probably call Uniden Parts and order one, but another good place is a company called Metro West. They have a cool catalog of interesting products for hand held scanners. Sorry I dont have the address (College Park Il. seems to come to mind).

"Tactical channel" is another name for a "fireground channel".
Aside from the benefit of freeing the dispatch channel from lots of
the on-scene tactical conversation, the "tac" chanels are often common
to a large area, so that mutual aid companies, who are dispatched on a
different channel than the first responders, have a channel in common
on which to coordinate.

In this area, we have lots of tac channels. Three (white 1,2,3) are
statewide common, four others are county-common, and still others
allow coordination to law enforcement, EMS units, and air tankers.
You'll hear the dispatchers assign a tac channel to the first-in
units, and all other incoming units will switch to the tac on arrival
or a little before arrival on scene, to receive their tactical
assignment from the Incident Commander.

The tac channels generally are not repeated (that is, they are
simplex). The range varies dramatically: 5 watt HTs inside a building
may be heard only blocks away, but a 100W truck radio on a hilltop
incident could be heard a hundred miles away.

Al Berg (alberg@hudlink.hoboken.nj.us) wrote:
: If you are a cordless listener, I'm interested in knowing:

: WHY you listen to cordless

Don't have much of a choice. I have a neighbor with an (illegal) grey market phone that overpowers a 49mhz room listener I use for monitoring the radio room. I can't change the channel on my room listener, so I just usually go ahead and listen. After all, it isn't MY fault!

: WHO you listen to - do you listen randomly or target your listening?

See above. And, occasionally, I random-search the band to see what other frequencies are in use in my area.

: Have you ever heard anything shocking or bizarre?
: Have you heard sensitive information (ie people giving credit card #s,
: travel plans, etc.)?

This particular individual just loves to talk about his business affairs over the cordless phone. I've heard banking account numbers, candid doctor conversations, and even user ID's and passwords for the company's computer system. Oh, and the usual mushy calls to his wife when he's out of town...

: Did you ever use any of the information you heard?

I once mailed the individual a transcript (anonymously, of course) of every cordless telephone call within a 24 hour period, however it only got him to not discuss private issues for about a week. After that, it was business as usual. Other than "educational" issues, I've never used the information.

: Do you think that listening to cordless is unethical? If not, why is it
: more ethical than tapping a land line?

In this case, ethics is not an issue. This bozo is interfering with my LEGAL use of a device, by using an illegal one. (There's no question this is a grey market product. This guy imports products from Japan all the time, and I've seen the phone. It's manual is in some Asian language.) IMHO, it would be the same as wiretapping someone who's busted in to your protector and using your phone line without your permission.

Less specifically, nobody owns radio (at least in theory). If his radio signal is present on my property, that's his problem. If I can hear it, I have a right to. To "wiretap" his phone over copper, there's a definate tresspassing issue involved. The telephone company's facilities are not mine, and I have no right to that.

: What kind of scanner do you use?

A Radio Shack Cordless Room Monitor reciever. (I also own an Icom R-1,
a R/S PRO-34, PRO-2005, and PRO-2026, and a Regency Touch M100.)

: Did you buy your scanner specifically to listen to calls or is this just
: a sideline?

I could care less about phone calls. I wish I could use my room monitor
for the purpose intended, not as a reciever for this idiot's phone.

Okay, so I'm on the soapbox a little. So sue me.

1375. MODing a Pro-43 without soldering

Newsgroup: rec.radio.scanner
Date: 1994-02-25 23:23:00 UTC
From: springel@umich.edu
Message-ID: <2km18k$6ii@lastactionhero.rs.itd.umich.edu>
Source record: 276823

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering
and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools
to help in the procedure.

4-The following procedure will void your warranty.

****

Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four
screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the

final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD!

Hope this helps those of you who do not own a soldering iron!

I just asked for a price quote on a PRO-43 from Marymac, for which they gave m
me a price of $259. I asked how long they would have it at that price and the
man said that it would be until today (Friday). Should I be worried that I
won't be able to snatch one up at that price within a couple of weeks? I would
have jumped in my car and drove to Houston from San Antonio and bought it if I
really thought that would be the case!

I have a handheld scanner and like most it doesn't have a tape out jack. There are occassions when I would like to record things but trying to do so using the earphone jack was not a pleasant experience. First of all plugging into the earphone jack cuts the speaker off, so you can't hear what you are recording. I also tried the duplex jack where I pluged the earpiece into one side and the recorder cable into the other. This was a dismall failure as it made the scanner top-heavy and turning your head would easily knock the darn thing over. I think I have come up with a way to tape and hear what's going on on the scanner without having to modify the scanner or buy expensive apmlified speakers.
I went to Radio Shack and paid $3.99 for a suction cup telephone pick-up (cat. no. 44-533). This device suction cupped to the Pro-39 worked wonderfully, voice actuation and all. I haven't tried it on the Pro-43 yet but I don't see why it wont work just as well. A couple of notes, first it doesn't work well around a computer monitor and second it may take a little experimentation to find the best spot, on the Pro-39 it picked up no noise when placed on the very front just below the key pad but had a slight hiss when placed on the back of the scanner.

There is a mod that restores cellular on the Pro-46! I know someone
who has done the mod and it works. And also has the proper 30 KHz
spacing too.

It invloves removing two chip resistors and placing one in another
position. You can find this mod somewhere in one of the radio modification
handbooks.

Neil (and others),

I have found myself a bit disappointed with the stock PRO-43 duck
- especialy when listening to the 800 mHz stuff. When I get back to St.
Louis, I find it inadequate for consistent reliable reception of the StL
PD 800 MHz trunked system. I gave ICOM FA1443B dual band (2 meter/70cm)
that I use on my handheld a try and was pleasaantly surprised at the job
it did. It is realtively short, unobtrusive and flexible. Anyone else
find this ham band antenna useful for scanners?

I recently recieved a catalog from Tucker Electronics & Computers.Inside were many nice "toys" among them were a couple of antennas made for scanning by a company called SIGMA.The two models are SE1300 and SM1500.The SE1300 is a discone antenna that covers 25-1300 MHZ and comes equipped with an "N" conn. It shows the standard transmitt capabilities.The SM1500 is a fiberglass radome enclosed vertical antenna that lists a frequency range of 500 KHZ to 1500 MHZ with 144 and 440 transmit capabilities.Now for the $64000 questions,has anyone used either of these antennas? And does anyone have an address or phone number for Sigma?I would like to know as I am seriously considering either or both for my station.Thanks.

I ordered a PRO-43 for a girlfriend from Marymac about 45 minutes
before the sale ended at 5PM Central Time yesterday. Their normal price
on the 43 is $289. I asked the guy at Marymac about how many 43s they
have left. He indicated that they bought outTandy's inventory of them,
but that Tandy didn't have the 43 listed as a 'discontinued' item, so it
is entirely possible tha the factory is still cranking them out.

Before I ordered it from Marymac, I also called US Radio (also in
Texas). They had the 43 on sale for $269 until the Radio Shack PRO-43
nationwide sale ended at 5PM CST. Their price was higher, but they
included 6 rechargeable batteries with it.

Whether or not Radio SHack has another sale on the PRO-43 will
probably depend on the quanitity that they have in stock in early/mid April.

>fax) with no reply. Then I asked for info from rec.radio.amateur.misc;
>the person who commented about ACE Communications detailed return
>hassles and said, "I won't do business with ACE."

ACE submitted a reprogrammed MVT-7100 to the FCC for certification last
year. The FCC turned down the application because they had not excluded
enough of the cellular frequencies, and the unit emitted too much RFI
(this radio is poorly shielded). ACE cannot legally sell this radio in the
US.

The MVT-7100 is a $600 radio. Are you sure the $399 price you was wasn't
for the MVT-7000?

>Unfortunately, the only other place I've heard of the MVT-7100 being

1392. Folded quarterwave antenna

Newsgroup: rec.radio.scanner
Date: 1994-02-26 14:57:18 UTC
From: hl1@hudson8.acpub.duke.edu
Message-ID: <2kno0e$k79@news.duke.edu>
Source record: 276749

In a recently marketed FM antenna (RF Limited High Q 6500), the antenna element is descibed as a folded quarterwave that is omnidirectional laid flat and highly directional when set on its side.

I am familiar with folded dipoles. Can anyone describe this folded 1/4 wave or perhaps give a reference to read?

My thanks to all who responded. A recent call to Damark informed me that
they were "SOLD OUT" and didn't know when they'd get more. I took a deep
gulp and went to RS and bought a Pro 43 instead. Yea, I know it's a jump,
but like I told the boss (my wife), I'm worth it. :-)

*** Bob's Tip of the Month ***

(from Monitoring Times, January 1993, Dial 1-800-438-8155, Great Magazine!)

Realistic (R) PRO-39 Cellular Restoration (Page 107)

[with a few comments added by someone who witnessed such restoration -jqt]

The recently released PRO-39 handheld scanner from Realistic (R)
is a fine performer, but its 800 MHz range is interrupted by the
factory censoring of cellular frequency coverage. Long-time MT
supporter Larry Wiland of Youngstown, Ohio, would like to share the
simple fix. Remember, however, that it is unlawful to listen to
cellular phone calls.

(NOTE: These procedures may void your warranty. Do not attempt
them unless you are familiar with small component soldering.
Monitoring Times accepts no responsibility for damages resulting from
attempting this modification.)

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick,
small Philips screwdriver, long-nosed pliers, rosin-core solder.

(1) [Turn off your radio. Removing the batteries when the radio is ON can
erase the memory! -jqt] Remove the battery door, holder and [battery
pack] from the bottom of the radio.

(2) Remove the four screws from the back of the scanner and carefully lift
the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six
bright colored screws [that hold] the circuit board in place. Unsolder
the ground wire from the lower right corner of the circuit board.
Unsolder the two wire connections from the BNC antenna connector at the
board. Carefully lift the board (grasping it near the Molex connector)
and set it aside.

(4) Remove the two bright colored screws from the next circuit board.
Carefully unplug the two-wire connector [and remove the board, as I
recall -jqt]. Unsolder and lift the rectangular metal shield exposing

the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the missing cellular frequencies which can be searched in appropriate 30 kHz steps.

This completes the cellular restoration. Reverse all procedures to reassemble the radio and test it by entering any frequency between 869-894 MHz. [If you are as lucky as I was, the memory will still contain your other frequencies! -jqt]

Curious about the other diodes? D4 would enable 68-88 MHz coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

Thanks Larry!

Not likely, that model just came on the market a few months ago as a replacement to the PRO-2030. You may have seen a PRO-2030 at this price on closeout.

1397. Modifying CB Antenna

Newsgroup: rec.radio.scanner
Date: 1994-02-26 16:08:34 UTC
From: reda@gandalf.rutgers.edu
Message-ID: <Feb.26.11.08.34.1994.2649@gandalf.rutgers.edu>
Source record: 276755

I recently hooked my PRO-43 up to my K-40 antenna and discovered that it performed as well, if not better, than the duckie. Since it is tuned down around 27 MHz, however, it pulls in the low band exceptionally well.

Question is, can these antennas be modified to pull in the higher freqs any better. IE: Can you cut it down, or remove the load or add another load?

As you can see, I know very little about antenna design. Any suggestions will be greatly appreciated.

TIA,
FRank

>fax) with no reply. Then I asked for info from rec.radio.amateur.misc;
>the person who commented about ACE Communications detailed return
>hassles and said, "I won't do business with ACE."

I've never dealt with ACE, but I believe I have the buyer's guide you
are talking about - 'CQ Amateur Radio 1994 Equipment Buyer's Guide',
right? The ad in question is one page 63? If so, check again, it's
listed at $599.

From my recent inquiries here (thanks again to all who responded - you
know who you are:) a comparable radio in your price range is the AOR
AR1500 ($450ish)

I'm about to take the plunge and cough up for the MVT7100 from the UK
Not that I can afford it but, errm, well, er I'm English and I'll be
helping the economy, yeah that's the ticket!

Wondering if my girlfriend will buy such a feeble lie,

\
You Bet!

I plunked the stock antenna from my IC-24AT onto the PRO-43 and was amazed at the difference. I figured it would almost *certainly* be an improvement for the 2m/70cm bands, and indeed it was, but it does a remarkable job on almost every other band as well ... certainly better than the equipped duck. I've since purchased a "spare" Icom antenna and couldn't be happier (for portable work anyway, I still use a discone for serious listening).

>turning your TV to an unused UHF channel...

Wellllll.... It is reported that the Tropez transmits an _unencrypted_
signal somewhere around 450 Mhz. A design flaw has allowed this image or
harmonic to be received in the clear.
Range of this signal isn't too great, but in my opinion, _any_
unencrypted signal defeats the entire purpose of the thing. But then what
can you expect from 1st generation junk eh?

Were these tones 5-10 seconds apart? Sounds to me like tones used in
my area sheriffs department when in an emergency.
This alerts all units on the frequency to not transmit unless they are
the ones involved in the operation. The bank robbery is a perfect
example. Only the cars involved in the robbery would be allowed to use
the channel during the tone duration. Traffic would be rerouted to a
different channel.

Good afternoon all,
Last weekend, my Pro2005's speaker lots about 90% of it's punch. I now have
to turn the volume almost all the way up to understand what is being spoken.
However, when I feed the audio through the line level out, it's just fine.
Even the extension speaker line is just as dead.

From the sounds of it, the amp stage is dead. Is this common? Any suggestions?
Again, it's a 2005, so it's well out of warranty.

Andrew,

I tried to order a Yupiteru MVT7100 based on the ACE Commun-
ications ad on page 11 of the November Popular Communications, shown
at $599. "Debbie" at ACE told me that they weren't in stock because
a whole container load had "disappeared in transit". After mulling
this over for a few days and becoming increasingly uneasy, I called
and cancelled the order. I have since learned that they cannot sell
that scanner legally in the US. I got mine from Javiation. In the
same issue on page 80 is another ACE ad showing both the Yupiteru
MVT8000 and MVT7000 for $399 each.

More than likely those tones are what is known as Emergency Traffic (ET). In my area (San diego) the local Sherrifs office seems to use them the most. All it means is that if you are not part of the current incident which is critical, to keep you mouth shut. It also lets other officers that may not have been listening that there is something going on which may require additional cover to respond.

: (A Lawsuit is in order) My carphone bill was charged 39cents per minute
: for every minute that a forwarded call was picked up. Now How can this be?
: I am getting charged airtime when there is no "air" being used!

Yes, a lawsuit is in order. But, its not because they are chargin air time for calls that don't actually use airtime. Its because they misrepresented the price of the service to you.

I saw the same posts and contacted my carrier- L.A. Cellular - who told me that call forwarding was free, but they charged air time. They gave me the same absurd story that you are using airtime, which is a bunch of crap.... So, I didn't bother doing it. Apparently, some places just charge $ .08 flat per call forwaded, which makes it worth it...

In short, you got screwed because your cellular company has morons working in their customer service department.

Call and ask for the President of the company and tell them what happened, they'll probably credit you for the calls. If not, threaten to switch to the "other" carrier in your area... I have found that Cellular companies can be very accomodating when you approach billing disputes in this manner.

I know little, and what I do know may be wrong, but here goes.

Length of antennae for different frequencies:

fullwave 1/2wave 1/4wave 1/8wave
frequency*light*miles -------- ------- -------

27mhz : (1/27,000,000)*186,000*5280 = 36.37' 18.18' 9.09' 4.54'
46mhz : (1/46,000,000)*186,000*5280 = 21.35' 10.67' 5.34' 2.69'
140mhz : (1/140,000,000)*186,000*5280 = 7.01' 3.50' 1.75' 0.87'
450mhz : (1/450,000,000)*186,000*5280 = 2.18' 1.09' ---- ----
800mhz : (1/800,000,000)*186,000*5280 = 1.23' 0.61' ---- ----

Of course a full wave antennae is best, if its practical.

Please, if I'm wrong here, someone correct me.

1417. Re: tones heard on police radio -- what are they?

Newsgroup: rec.radio.scanner

-> More than likely those tones are what is known as Emergency Traffic
-> (ET).

Those tones are indeed sent during 10-33 (emergency) situations. 10-34
is resume normal communications. If I hear 10-333 tones, I stick to that
freq - it means something NASTY is going on.....

1418. Hustler Discone for $19 at Tucker Electronics!

Newsgroup: rec.radio.scanner
Date: 1994-02-27 03:32:00 UTC
From: copeland@metronet.com
Message-ID: <CLv5tC.IJt@metronet.com>
Source record: 276676

I just bought a Hustler DCX discone antennae for my pro2006. It seems to bring in more than my old whip antennae, but I can't compare it to other discones since this is my first.

Its rated at 40-999 Mhz. It has no top element, but one could probably replace the bolt in the top with hex standoff with a female top part. It has three 55" aluminum elements on the bottom and three 15" elements on the top. It comes with a PLC connector, but no cable.

It only cost $19 !!! (Tucker had a 12' cable for $7). It appears perfect for an attic installation, but I'm not sure its sturdy enough for outside installation.

I got it at Tucker Electronics (1-800-527-4642) here in Dallas,TX

They sell a wide range of scanners,radios,transmitters, antennae. New and used. They also have very nice catalogs.

Cellular Restoration on the Realistic PRO-2022

The Realistic PRO-2022 certainly is a look-alike for the all-time popular, but now-discontinued, PRO-2005. But is the similarity only cosmetic? What tricks can be done to increase the utility of the lower-cost 2022, now availible from Radio Shack and Grove Enterprises? Of the greatest interest, can cellular phone coverage, censored at the factory, be restored? Yes.

After removing the two upper back screws and the top lid, locate the black cable just behind the front panel. Adjacent to the cable are four diodes locations: D42, D43, D44 and D45.

D42 is not present; installed, it adds the 68-88 MHz European mid band (which includes the US 76-82 MHz mid band), removing the US 30-54 MHz low band. Even if a switch were installed to allow the diode to be selected, additional components and realignment are necessary for that higher frequency coverage. Don't do it!

D43 is present, allowing the 800 MHz band to be received; the diode may be deleted so that the same microprocessor may be used in scanner modles which don't have that 800 MHz capability. Don't touch it!

D44 is present, deleting the cellular mobile and base frequencies. If one lead is cut, total 806-960 frequency is restored, including 30 kHz steps in the cellular band. Keep in mind, however, that mobile telephone eavesdropping is prohibited by the Electronic Communications Privacy Act!

This modification may void your warrenty; it is best to cut the lead carefully, gently separating the gap slightly so that it may be resoldered in case the radio needs warrenty repair later.

D45 is not present; installed, it makes the cellular 30 kHz increments change to 12.5 kHz. A small SPST switch

connected in series with one lead of a 1N914 or 1N4148
could allow selection of the 25 kHz step interval in
those areas which utilize that channel spacing.

To do this, it is necessary to unsolder a shield under the circuit
board which covers the solder pads for the diodes. Such a modification
should only be attempted by someone familiar with electronic circuitry.

[Excerpted from Monitoring Times, June 1990, page 89.]

Also, the Mod for scan speed is done by the following..
Take a look inside the top cover, and on the side of the board toward
the front of the scanner on the right, there is a little blue square chip
that has 3 pins on it. That is your crystal that oscillates at around
2 mhz. If you take that one out, and get a crystal that runs NO
HIGHER THAN 7MHZ, (5 being the highest reccomended) and put the new
one it, voila! you get like 30chan per sec scan speed.
The new crystal should be rated for microprocessor use, or similiar,
and don't worry, the new one will only have two pins on it, compared
to the one that you are taking out, which is 3 pins.
The only thing you have to worry about now, is your scan delay.
If you are interested in building a longer scan delay, get the
scanner modification handbooks by bill cheek, it tells all about them.

IC's normally last at least 20 years before oxidizing and going bad. I imagine
getting new rubber keypads would be the worst problem.

I want to thank the fellow who suggested using a telephone pickup coil attached to a scanner to activate a vor. I tried it with the Pro 43 and it works like a charm using a Sony Vor. A problem with using the audio out headphone line is that a vor will activate just on the poping from the internal operation of the scanner. Even placement of the pickup is some what critical. Too close to the lcd display and it will pickup electrical noise from the display refresh line.
As a matter of fact while moving the pickup around in space I was able to watch the led on the Sony recorder and spot just where noise was present when there was no signal. I settled for the back of the radio just below the area of the belt clip. Turning the volumn up slighlty gives just enough electrcal field so that the audio is passed to the vor when there is a signal.

While I was at it I used the little pickup to test for electrical noise from a variety of sources. The 486dx generated a fair amount at about 4 inchs, various clocks, monitors, answering machine etc all where somewhat noisy as I had allways known. The suprising thing was that the noise was somewhat directional more in certain quadrents then in otheres.

Replaced the cable with RG-8. Still works great with the 800XLT. Still seems to overload the 8500XLT. If I hold the cable physically close to the 8500 (but not connected) I get great reception. If I try to physically connect it, I got distortion. Seems to me I am getting too much signal. Does anyone know where I can get a attenuator (or does anyone even think it will work. Has anyone tried the Scanner Filter from Groove? I don't think it's the radio because it works great with the antenna that came with it. I just think it is getting too much signal.--

Well, there's a German company STABO and I bought one of their scanners
XR100 they call it, for DM 950,- at a local electronics store. From what I
have seen of the MVT7100 on a leaflet, mine looks exactly the same. The specs
are the same and it even came with batteries installed that had the
YUPITERU brand name on it. The frequency range has no gaps, and it doesn't
seem to be modified in any way. The specs correspond in every way to those
I have found for the MVT7100 in a review I got by ftp from funet.fi.
The scanner came with a stamp and an accompanying document by the German
Office for Telecommunications saying that the object complies with the German
regulations for broadcast receivers.
Of course, the price isn't that much more attractive than those already
cited by others.

>I may need to buy a new battery pack for my old
>BC100xlt.
>Where is the cheapest place? Any ideas?
>Mack

Mack,
I recently purchased a new battery pack for my 100xlt (BTW - same battery as 200xlt) at Quement Electronics in San Jose (California) for $35 (maybe $40?). I suppose a well equiped electronics store (not RS .. $60 at RS!) in your area might have some.

Another, less expensive, option is to replace the individual cells in the battery. While I haven't done this with my scanner (I need a second battery), I have done it with my camcorder battery and a rechargeable flashlight.
**
I have't actually done this with the 100xlt battery and I am assuming construction similar to other NiCad batteries.
**
1) Open the battery (don't fret breaking it, you have nothing to lose) and note the configuration and size of the NiCad cells.
2) *Now* you may go to Radio Shack (or other electronics store) and purchase cells of similar size. The 100xlt has "slow" charge cells, don't purchase quick charge cells.
3) Un-solder the old cells and the little "thingie" (probably a themo-device) between the cells.
4) Solder the new cells in *exactly* the same orientation as the old cells, including the little "thingie".
5) Give the new battery a good 14 hour charge before using.

>And the new FBI wiretap bill is going to criminal *cordless phone*
>listening as well as a bunch of other new segments.

I keep reading about the great impending lockout of various frequencies from scanner users in April- my question is, what else am I going to miss if I don't really care to listen to cellular or cordless phones? Will the blocked ranges include business/public safety frequencies of any sort?

I missed what the exact ranges to be blocked are: does anyone have a list available?

I would recommend it only in you need a scanner which must be small and pocketable. It has too many performance compromises to be satisfying as a primary rig.

The trouble is it is hard to (1) know what bills will actually be passed into
law and (2) how that translates intoa directive for the fcc to change the
type approval process to force scanners to obey congressional mandates.

Even after April there will be cell capable scanners around for a while,
they still can be sold just not imported or manufactured. In a few
years they may keep up their resale value though.

Public saftey in the Atlanta metro area often makes use of
celluar phones for 'confidential' communications. You ain't going to hear
these if you can pop up to that area when they do.
Our public servants aren't dummies (well most aren't) and they
know most people (ie bad guys) will not be able to monitor them discussing
a upcoming bust etc on the celluar telephone system. I spoke to several
GBI agents after an abortive bust and advised them that their comm on vhf
was wasily copied by me just a few blocks away while I worked with the
computer. They said they knew that they could be copied but that the scuss
balls they were after were too dumb to be tipped off in advance. They
indicated that for the really dangerous stuff they used a state cellular
phone account to talk to one another.
Incidently when I 'dropped' by where they were gasing up to speak
to them they where all driving Mustang's with Fla plates and they looked
like the scum of the earth, really rough! I examined them for several
minutes before I was sure I had the right guys and you sould have seen
their faces!!!!! Ha HA

Here is a collection that I've compiled from alt/rec.radio.scanner.

Also, one of the Monitoring Times columnists took his scanner to Disneyworld.
He wrote an article about it, and I think included some freqs for it. I think
the issue is less than 6 mos. old. Maybe someone on the group knows which
issue it is. One other thing: The columnist reported that the Disney Gestapo
prohibits scanners and the such in the park. Bleh.

Stuff in "<<<" ">>>" are my own personal comments.

|Subject: Disney Frequencies Galore
|
|OK, for all of you guys that can't put your radio down when you go on
|vacation - The (un)official list of Walt Disney World Frequencies.
|(I'll give you a hint... I work at the Magic Kingdom, so this is about
|as official as it gets.) All of these frequencies are confirmed; They
|were obtained from WDW Radio/Audio Central and traffic has been heard on
|each frequency.
|
|Anything with a * indicates simplex and probably very low power. (The
|radios we use at 20,000 leagues are only 1 watt for operators and 4
|watts for leads) If you don't hear anything, don't yell at me about it,
|you just aren't patient enough!
|
|151.895 20,000 Leagues Under the Sea *
|452.650 Cash Control (Wells Fargo Trucks) *
|463.975 Custodial Base (EC and MK)
|469.3375 E - Stops (Attractions) *
|148.100 E-Stop Great Movie Ride *
|462.550 Entertainment 1 (Characters)
|461.300 Entertainment 2 (Parade Dispatch/Traffic
<<>>
|464.9375 Entertainment 3 *
|464.500 Entertainment 4 (Special)

|453.825 Fire Channel 1 (Reedy Creek Fire Rescue) <<>>
|463.750 Hailing (Disney - MGM Studios)
|464.125 Hailing (EPCOT Center)
|464.400 Hailing (Magic Kingdom)
|154.47875 Light Barges (Electrical Water Pageant) *
<<>>
<<>>
|462.675 Maintenance 1 (EPCOT Center)
|464.625 Maintenance 2 (Magic Kingdom)
|464.800 Maintenance 3 (Disney - MGM Studios)
|462.650 Operations 1 (EPCOT Center)
|462.575 Operations 2 (Monorails) <<>>
|462.625 Operations 3 (Magic Kingdom)
|461.600 Operations 5 (Disney - MGM Studios)
|464.600 Operations Simplex * <<>>
|157.740 Pagers (no input)
|462.775 Pagers (no input)
|462.850 Pagers (no input)
|464.0625 People Finder *
|468.8125 Point of Sale Systems *
|462.475 Reedy Creek Energy Services
|464.200 Resorts 1
|461.700 S.T.E.P. (Fireworks) <<>>
|151.655 Space Mountain/Riverboats/Studio Trams *
|451.500 VUT
|461.3375 Warehouses 1 *
|461.9125 Warehouses 2 *
|
|Also, Disney is steadily moving a lot of stuff to a 12 channel trunked system
|in the 800's. Currently, Security, Resorts, and Watercraft (plus some V.I.P's)
|use the system. I've seen the charts, and most of the traffic will move there
|within the next few years. Also, Disney should be setting up a 900's trunked
|system also. So, many of the non-theme park frequencies may be moving there.

<<>>

Enjoy...

In addition to the Freq. posted, here are a few a friend gave me.

855.7875 WDW PHONE
856.9125 "
858.8125 WDW PARK
852.2375 REEDY CREEK EMS
852.7375 REEDY CREEK FIRE
853.7125 "

852.3625 "
853.4625 "
854.3375 REEDY CREEK FIRE PHONE OPTION
851.3125 SECURITY
855.1875 "
855.6875 "
855.8875 "
858.8125 "
859.7875 "
857.7875 WDW CONSTRUCTION

Some of these are 'trunked' and the 'control' freq. changes every day, so you'll need to lock out the culprit and unlock the previous days control channel.

The 2006 is a triple conversion unit, with similiar, if not identical IFs.
Don't have the tech specs in front me for an exact IF comparison.

The only image i've noticed on the 2006, is a TV transmitter's audio at
880.260Mhz here. That's in stark contrast to a Uniden made PRO-2026 and 800XLT
that I've owned. Images galore.

In southern Ontario.. most of them are at 30.8500 mkz (and some Burger Kings
are at 30.4500)

1443. BC100XLT vs PRO-46

Newsgroup: rec.radio.scanner
Date: 1994-02-28 03:52:28 UTC
From: m_roberg@oz.plymouth.edu
Message-ID: <1994Feb28.035228.22711@oz.plymouth.edu>
Source record: 276701

I'm looking to upgrade from a 10 channel portable scanner(PRO-42) to a 100 channel portable and was wondering whether people preferred the PRO-46 or the BC100XLT. Which one is better quality overall, and also which one has better quality reception capabilities?

The BC100XLT is available for 159.99 from Scanner World as opposed to the PRO-46 which lists at 229.99, so I'd rather get the BC100XLT as long as it is pretty much the same as the PRO-46. I am not really interested in the lack of 800 frequency since I'll be using it in rural New Hampshire and it hasn't progressed this far yet.

Thanks,

Matt

Hello,

I'm selling my Uniden BC200XLT scanner for $175 firm plus s/h (or
you can pick it up in Chaple Hill). This scanner has 200 memory
locations and recieves police, fire, etc., cellular and cordless phone
transmissions. The scanner is in excellent condition and comes with
a power supply/charger and a manual. I also have a mobile and an
outdoor scanner antenia for sale as well.

I have one and I would echo Mr Schuster's comments. It is the only
scanner I have that I probably would not buy again, despite its neat
appearance and the intriguing idea of such a compact receiver.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how | to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors | deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive | baby monitor intercom. *

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. Change is in the wind -- it will soon be illegal for companies to sell scanners which cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have recently enacted laws against | listening to cordless phones, but it's currently legal to | listen in most states. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend AOR brand scanners.

Programmable (synthesized) units have replaced crystal con- | trolled models as they don't require crystals and usually | have a keypad that permits you to store frequencies into | channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you

get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners | almost always provide more audio than portables, and port- | ables are usually more prone to interference when connected | to outdoor antennas than base models. But when severe | weather knocks out the power in your home, there's nothing | like having a battery operated scanner to monitor the power | utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables. |

Scanner Antennas |

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and

ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise and Circuit City sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- Scanner World (Albany, NY). Telephone (518)436-9606. |

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymack Distributing (Katy, TX) sells Radio Shack scanners at discount. Telephone (713)392-0747. |

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner |

If you are handy with a soldering iron, you may be | interested in modifying your scanner to add features or | enhance its performance. Be warned this usually voids your | warranty. Modification article files can be copied from | several ftp sites including the /pub/ham-radio/mods direc- | tory at: |

ftp.cs.buffalo.edu |
garfield.catt.ncsu.edu |
ftp.std.com (IP address 192.74.137.7, world.std.com) |

Scanner Repair Shops |

Is your scanner broken? Aside from sending the scanner | back to the manufacturer for repair, here are least two | companies which repair scanners: |

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by

CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose

the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict | rules for the AOSCNet Scanner Radio Echo (as of 2/1/94): |

1. No discussion of cellular modifications or discussions | on how to monitor cellular transmission. |
2. No discussions on topics which would violate the ECPA | '84, TDDRA '93, (18 USCA 2510 et seq.) or Communica- | tions Act 1934 & 1984 as amended (47 USCA 705), i.e., | decoding/reception of paging, cellular, encrypted | stuff, descrambling etc.. |
3. No Aliases. |
4. No discussion of Shortwave or Amateur Radio material | (except SAREX). |

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association |

The Chicago Area Radio Monitoring Association (CARMA) is | the foremost club for scanner radio hobbyists in the north- | ern Illinois area. CARMA was formed from the Chicago | chapter of the Radio Communications Monitoring Association | (RCMA), and we have been meeting since the early 1980s. |

Many CARMA members are active in ham radio and GMRS, but | the club is devoted to scanning and scanners. |

Meetings are held on Saturdays at area restaurants, about 6 |
times a year. Although lunch starts at noon, the meetings |
begin officially at 1 PM and often run until about 4 PM. |
You must purchase a lunch since we get the room for free. |
Meetings consist of a quick review of club business, some- |
times a special presentation, and a "round table" |
discussion/question & answer session. Large quantities of |
information and frequency lists are often distributed in |
the form of free handouts. Members sometimes sell radio |
equipment at the meetings, too. |

In addition to regular meetings, there are two CARMA |
picnic/field days during which members meet at a park, |
erect antennas, eat, and operate scanners from battery |
power. CARMA members take organized tours of various com- |
munications facilities in the area. |

Club meeting dates and times are published in the CARMA |
newsletter, published 6 times a year. A one year subscrip- |
tion is available by mailing a $10 check, payable to Kim |
Moran, to:

The Command Post |
attn. Kim & Ted Moran |
6143 W. Touhy Avenue |
Chicago, IL 60646 |

Many CARMA members participate on the CARMA computer bul- |
letin board, run by Will Sperling. If you have a modem and |
terminal or computer, you can reach the CARMA BBS by cal- |
ling (708)852-1292. |

Here is a tentative meeting schedule for 1994. All meet- |
ings will be held on Saturdays at the Destiny Restaurant, |
1440 Rand Road, Des Plaines, IL: |

February 19 |
April 16 |
June 18 |
August 13 |
October 15 |
December 10 |

Bring a notebook and your appetite.

Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc

In article <2kk7p0$t5d@zone4.ocunix.on.ca> (posted to rec.radio.scanner,rec.radio.amateur.misc on 25 Feb 1994 02:01:52 -0500), andrew@zone4.ocunix.on.ca (Andrew Cornwall) writes:

= Unfortunately, the only other place I've heard of the MVT-7100 being
= available is Javation, who's charging UK L385, which is way out of my
= league.
=
= Can anyone solve my dilemma?

Since you are in Canada, you might want to check out Radio Lorenz in Montreal. I bought my Yupiteru MVT-7100 from them and I was pleased with their service. Price was CDN $739.00 plus shipping (December 1993). I've included some additional information below from a file I occasionally send to people who ask about sources for the MVT-7100.

===
=== Notes on buying the Yupiteru MVT-7100 in North America ===
===

According to stuff I read in rec.radio.scanner and related newsgroups, unblocked Yupiteru MVT-7100 radios are available from Radio Lorenz in Montreal and Javiation in the U.K (see addresses and phone numbers below).

I opted to buy from Radio Lorenz primarily because I thought that warranty service, if needed, would be faster and cheaper. Including shipping and other considerations, the price from both suppliers appeared to be about the same. (Note that I'm in the U.S.; prices compared in mid-December, 1993). But as far as I can tell, any warranty a North American customer may obtain on the radio is provided by the retailer, and requires that you return the radio to the retailer for service. Lorenz offered a one-year warranty--if the radio breaks, purchaser ships it to Lorenz, and Lorenz ships it to the Canadian distributor (located in London, ON) for repairs. I assume, but do not know, that Javiation's policy is similar. I decided that it would be cheaper and faster to return the unit to Montreal than to the U.K.

Another advantage of buying the MVT-7100 from Lorenz is that they provide an AC adapter designed for operation in North America. Two reviews which have been posted to the net complain that the MVT-7100s supplied by Javiation come with an AC adaptor designed

for use at 100 V and cause the radio to run warm.

Lorenz supplies the regular Yupiteru manual, plus a reprint of one written by Jonathan Clough of Javiation. I'm not sure whether the reprint is identical to what you would get if you buy the radio from Javiation. It looks like something which may have been posted to a BBS and then printed out. I had no trouble learning how to use the radio from reprint in combination with the Yupiteru manual. The Yupiteru manual itself it not great, but not terrible either; I've seen much worse.

I was pleased with the friendly and helpful service I received from Helmut Lorenz. I asked him to ship the radio in a manner different than he was accustomed, and he was very cooperative.

Jonathan Clough of Javiation was also helpful when responding to my emailed inquiries.

1450. FOR SALE: Radio Shack PRO-34 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-02-28 15:49:21 UTC
From: martin@dvorak.amd.com
Message-ID: <CLxyMA.4JL@dvorak.amd.com>
Source record: 276708

I bought this unit a couple of years ago and never did get into listening as I thought I would. The unit has 200 channels in 10 memory banks and covers frequencies to 960MHz. I have performed the modifications on it to add back the "cellular band" from 869-896MHz. Here is a list of frequencies covered:

VHF-lo (30-54Mhz)
Ham (50-54Mhz)
Aircraft (a08-136Mhz)
Government (136-144Mhz)
Ham (144-148MHz)
VHF-Hi (148-174MHz)
Ham/Gov't (380-450Mhz)
UHF-lo (450-470MHz)
UHF-TV (470-512MHz)
UHF-hi (806-824MHz)
(851-868Mhz)
(868-891MHz) <--- Cellular band, added back in
(896-960Mhz)

The unit has some pretty nice features and used to be the flagship of the RS line. The unit looks functionally identical to the PRO-39, which sells for $299.

Asking: $210 OR (make me a) BEST OFFER. I'll pay shipping.

Martin Schuessler

1454. Scanners on aircraft!

Newsgroup: rec.radio.scanner
Date: 1994-02-28 19:10:23 UTC
From: mike@garfield.csuohio.edu
Message-ID: <1994Feb28.191023.4759@news.csuohio.edu>
Source record: 276712

I have seen (and taken part in) several threads discussing the
issue of operating radio scanners aboard commercial aircraft.

The following two items have been reprinted without permission from
the Continental Airlines February 1994 issue of Profiles in-flight
magazine. The first item is from page 73 and describes what
electronic devices are/are not allowed on board. The second item
is an informative article from page 66. Enjoy.

ITEM 1

Continental Airlines' Profiles in-flight magazine, February 1994,
page 73 at the bottom by the radio symbol, verbatim:

"Certain electronic devices may not be used aboard the aircraft at
any time: TV's, radio receivers or transmitters (AM/FM, CB,
scanners, remote control toys, etc.) and cellular phones.
Permitted are: pagers, calculators, shavers, cameras, tape players
and recorders (audio or video), and bionics (hearing aids,
pacemakers, etc.). Additionally, electronic games, personal
computers and CD players may be used except during take-off and
landing (below 10,000 feet)."

ITEM 2

Continental Airlines' Profiles in-flight magazine, February 1994,
article on page 66 under "Continental Country":

Calling All Stations

"New rules govern the use of portable electronic devices in flight"

By Lockwood Tallman

People who fly frequently have noticed that cabin crews are
making some new announcements, such as, "Once airborne, you will
be advised when the use of approved devices is permitted," and "The
use of approved portable electronic devices is now permitted."
The announcements are the result of new rules designed to
limit the effects of electromagnetic interference (EMI) on the
aircraft's navigation and communication systems. It has long been
recognized that personal electronic devices can emit EMI, and for
this reason airlines have banned the use of AM/FM radios and
televisions by passengers on board.
But along with the electronics revolution has come a plethora

of portable devices that easily take to the air with travelers.
Both the Federal Aviation Administration (FAA) and the aircraft manufacturers have provided information to the airlines concerning this trend and the need to ensure that increased use of portable electronics does not compromise the aircraft's own electronics.
On Continental aircraft, portable electronic devices fall into three categories: items that can be used at any time; items that should not be used during taxi, takeoff, climb, approach and landing; and items that should not be used at any time aboard the aircraft.
Authorized for use at any time are tape players/recorders (video or audio), cameras, shavers, calculators, pagers, wristwatches and medical devices, including hearing aids, pacemakers and FAA-approved life-support systems.
Authorized for use while the aircraft is cruising (not during taxi, takeoff, climb, approach and landing) are electronic games and entertainment devices (such as "Gameboys"), personal computers and compact disc players.
Not permitted at any time are televisions, radios, cellular phones, CBs, remote-controlled toys or any other kind of transmitter.
Televisions and telephones installed on board the aircraft are acceptable because they have been installed with the required shielding and have been FAA-approved specifically for inflight use.

Caption under photograph of a Continental 747 in this same article:

" 'Gameboys,' CD players and PCs should should be used only when the aircraft is cruising - not on takeoff or landing, when the electromagnetic interference they emit could interfere with the aircraft's own electronics."

Well, from what I can tell, this pretty much eliminates radio scanners, ham HT's (even if just receiving), and shortwave receivers from being used on aircraft, at least on all Continental flights. Depending on your airline, your mileage may vary.

Your best bet is to ask a flight attentant, or better yet the captain herself/himself or appropriate pilot-in-charge.

Hope this helps.

Mike

Grady Ward (grady@netcom.com) wrote:
[stuff deleted]

: Even after April there will be cell capable scanners around for a while,
: they still can be sold just not imported or manufactured. In a few
: years they may keep up their resale value though.

I'd venture a guess that the supply of used cellular capable scanners will outlive the unencrypted 800 MHz FM cellular system itself. It seems like a big waste of time and money.

The other thing that worries me is that the supply of cordless-capable receivers will probably never run out (heck, almost anything will receive them. Are they going to stop selling crystals at that freq, too?). Instead of passing such a ridiculous law, they should inform the public as to the current state of affairs. The market would demand secure cordless phones and the manufacturers would deliver it. A much better solution IMHO.

I'm probably preaching to the choir here, though.

Regards,
Neil

Hey, I got 30-year-old _tube_ gear that's still working fine, and the
solid-state stuff should certainly outlast that. I think they're
speculating--hoping to find a buyer willing to part with big bucks for a
no-longer-available receiver.

|The columnist reported that the Disney Gestapo
|prohibits scanners and the such in the park. Bleh.

Personally, I think that there's a market for a scanner that is disguised as a Sony Walkman. Some of the older type Walkman units have the volume of radio scanner. If you design the unit to work into headphones only, you could have a scanner that will work many hours off of 4-6 Nicad AAs. Of course, an internal speaker is nice to have.

You could design the scan controls to emulate the push-button controls on a tape player, and design the keypad into either behind the folding "cassette door" or possibly into an elastometric keypad that would be integrated into a geometric design on the outside of the case.

The manufacturer could create several designer colors to further the deception. Of course, it would incorporate EEPROM programming like an AOR AR-1000 to allow reprogramming around the cellular scanner ban. The standard practice of using the headphone lead as the FM antenna should bring some benefits when trying to scan cordless phones, as compared to the using a whip or rubber ducky antenna.

A niche market to be sure, but, how many people carry around a scanner with it's "brick" configuration, as compared to those willing to carry a scanner if it were in a swollen "Walkman" configuration with a headphone antenna? I know that _I_ would like a scanner like that...

: ....and don't forget to get your wallet out...this FTP costs $$$.

No, it does not. As lots of i-net connected folks have discovered, there is a sign-on message when you FTP into ftp.std.com (and it also appeared for a time at the world.std.com address). This sign-on message contains information and rates for establishing *your own* account on world.std.com. As long as you are only there for anonymous FTP, there is no charge.

Also notable is that the ftp.std.com address supports unlimited anonymous connects, so you won't get the "system load too high" message that you used to get with the world.std.com address.

If there had been any *required* money for file access, I would have never placed the ARRL's Email Information Server files there (with the generous help of Scott Ehrlich).

You might want to use an attenuating cable (Radio Shack sells them,
they are noticable by the bright RED plug cases) to better match
the headphone jack with a VOR. The cable is cheap, not subject to the
noise problems, and works fine with my Pro 39 and RS VOR. (A straight
cable will not work due to the AGC locking onto the background level...)

Jim use a tv attunator which you can pick up from the infamous radio shack chain. Don't worry about 50 ohm 75 ohm impedance mismatch as that stuff dosn't mean a thing when it comes to scanners it is only relevant when you are transmitting.

Javiation
Carlton Works, Carlton Street
Bradford, West Yorkshire
BD7 1DA England

Voice: 011-44-274-732146
Fax: 011-44-274-722627

The proprietor, Jonathan Clough, can be reached by email at
clough@javiaton.demon.co.uk or 100117.535@CompuServe.COM

Price is 385-399 pounds sterling ($575-$600) depending on exchange
rate (pound-yen) delivered by 2nd day FedEx. If you're hit with
customs duty, it will be 6%, or about $30.

There is a 12 month warranty but (obviously) you'd have to send the
radio back to England for service.

==========READ NOW!!!!==========

Jonathan is in the US right now on vacation. He is leaving for home on
March 6 (when I last heard) so don't expect any orders to be filled until
then. He was back-ordered at least a couple of weeks when he left due to a
groundswell of orders related to the April deadline.

Reports I've heard on alt/rec.radio.scanner is that the Panasonic is using a standard FM analog signal for voice. The 'handshaking' between the base and handset is digital, evidently allowing Panasonic to call their new 900Mhz phones a digital phone of some type. Whatever.

Here's some 900Mhz cordless freqs from my archives. They're a couple posts from two other newsgroup readers/contributors.

Subject: Panasonic 900 MHz phone freqs.
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo conference:

Panasonic 900MHZ Cordless Freqencies:

Color of Phone	CH	BASE	HANDSET
Blue	01	902.100	926.100
Hot Pink	02	902.130	926.130
Banana	03	902.160	926.160
Cerise	04	902.190	926.190
White	05	902.220	926.220
Off White	06	902.250	926.250
Gray	07	902.280	926.280
Fuschia	08	902.310	926.310
Shocking Pink	09	902.340	926.340
Chartreuse	10	902.370	926.370
Neon Purple	11	902.400	926.400
^	^	^	
^	^	^	
^	^	^	
Black	59	903.870	927.870

They Both increase at .03 Mhz for each channel...

I keep seeing references about this magazine in this group but I
have been unable to lay my hands on it.

There seems to be no library holding it in NZ and possibly not in all of
Australasia. This depresses me.

What is in this magazine ? What sorts of things are covered ? Is it a
technical journal ? A meer conduit for adverts ? A product review / issue
type journal ?

What things does it cover, just scanner related stuff or radio related or
electronic in general ? Gossip and inuendo on a topic or actual schematics
and lists of design specs for a given system ?

Who publishes it ? What is their address ? I have T&L Publications , Corona,
CA. ISSN 1065-2035. Can anyone offer me more ?

Email replies to PGUNN@alkali.otago.ac.nz to avoid net clutter. I'd like
your impressions as well as answers to the specific questions posed above.
I'd especially like replies from people in NZ but please anyone reply.

Thanx in advance.

The older Panasonic 900Mhz phones were analog, however I've seen
ads for this new product line, which specifically has wording alluding to
the RF circuit being 'scrambled.'

I assume that just like most of the other 900MHz cordless phone
manufacturers, they're LYING, and the audio over the RF channels is
simply codec'd from analog to digital -- trying to equate encoding with
encryption.

---

Below is a collection of SW receiver reviews written by readers of Rec.radio.shortwave. The number following the brand and model number is the number of readers, who indicated they use this type of receiver.

All credit for these reviews should be given to the readers of this group and not me.

John Lloyd

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in
the front or side pocket of an average sized backpack. It is just great
when you are walking back home from school/work ... it can be easily
carried in one hand as you catch up on the news from
BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on
occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep
with music... the FM sound is pretty good in stereo (headphones)... The
AM reception is also fairly good but it has a very high tendency to catch
those Bible bashing stations...probably a reflection of the region where
I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 - 1

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power

supply included.

An outstanding performer, and worth the price to a serious SWL
or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the
GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The
Sony is slightly smaller and has a somewhat more "finished" feel
about it. The Grundig is SOLID with a much better sound. Neither
is as good a SW signal receiver as the previous Sony, the '2010
(2001). However, they both have very advanced features;
multiple (and in the Grundigs case, expandable) memories with
alphanumeric tags so that you have a name as well as a frequency,
all sorts of memory grouping and scanning etc. The Grundig has
good RDS ident. on it's FM band, but I have a feeling that this
isn't used much, if at all, in the US. If you intend to buy
second-hand, be very wary of the SW77 - the early version was
pretty flakey. The later version is better but still not as good
as the '2010.
I think that the choice comes down to "feel". They are both quite
complex to use, but both work as advertised. Try 'em both as they
have quite distinct operational methods. If sheer performance on
SW is the main point for you, compare them with the Sony ICF2010.
You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the
Grundig. I have my Satellit 700 in daily use and it's performed
without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to
the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in
the set, which is how I have it set up. (The SW77 used C cells)
They both run down batteries fast. The Sony worse than the
Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer
heft of the Satellit. A Satellit with a full load of 4AH Nicads
can tip the scales at twice the weight of a SW77. Of course, if
drop one on your foot the Sony would be the better bet ! I
only use the Grudig about the house. I have a '2010 for the
road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following

message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700.
The sound from the radio is truely impressive! I have always
wondered why broadcasters put music on shortwave, because it
alway sounded like garbage. However with the 700 I can listen and
enjoy the music. The 700 has Bass and Treble controls, which
improve the sound quality but the Automatic Gain Control most
likely does the most toward improving the sound (I'm not an
expert, so this is just a guess!). Anyway my Wife
regularly listens to music coming from a 60m band radio station
in Guatemala, and can enjoy the sound. However there are some
bad points. It is programable, but I have not worked out how to
do it yet. Well I tried once and gave up. This is not too
bad though, because BBC, Deutche Welle, and about 10 others
are stored in a ROM table. And these frequences actual work
(i.e. they are the frequencies for North America and NOT
Germany).
Also I connected a long wire antenna and found my local AM
station on shortwave. I guess the front-end is not good enough to
sort the signals out when coming from a large antenna. But don't
worry about this either.
If you only want to listen to the biggies like BBC, Deutche
Welle, you won't need an external antenna. I am planning to put
a Pre-selector between The Radio and the Antenna, and I think
this will cure the problem of AM stations on shortwave and cut
out some interference. Finally I recommend this radio to you. I'm
sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is
still an excellent piece of equipment. Excellent sensitivity and
selectivity. Digital display with two separate clocks (only
one displayed at a time), signal strength meter, frequency
readout, and four-character user-definable "name" for each
memorized station. 42 memory positions. Tunes to .1 kHz
increments. Selectable wide/narrow bandwidth for AM mode
reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry.
In addition to AM, has three receiving "modes" for LW, MW, and
SW: USB, LSB, and "Sync," which should more accurately be
described as "fine tuning," as this implementation of synchronous
detection operates differently from the Satellit 700 or Sony
2010. Selectable automatic/manual gain control. Covers LW
(150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM
(87.5-108 MHz).
Excellent audio output, with separate treble and bass controls.
Stereo through headphones. Line-level out (mono), external
antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued,
many outlets are selling this unit at close-out prices, making
this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it.
I miss the 512 memories of 700 and 'SSB clarify' control
sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However,
it is rather simple to make it work similarly to '700 and '2010,
because the detector chip is the same in all three. Only a switch
with two pairs of contacts is needed. Another design fault, the
excessive distortion in SSB mode, can be partly cured by adding
two resistors. For serious DX-ers it may be important that the
internal ferrite rod cannot be disabled on MW and LW in both 500
and 700, so the in-house noise may become a problem on these
bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise.
Similar number of cubic inches as the Sony (different shape), but
offering some features of the R8. Also the Lowe is made with a
mostly solid alumnum case, which is better than the Sony or the
Drake. The Lowe has dual antenna inputs (wire or SO-239), record
out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes
8 internal AA nicads *OR* disposable batteries. It will recharge
the nicads with a builtin recharger if you plug it into
an external power supply. It's a nice semi-portable radio. It
has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with
it. I use it mainly for broadcast listening. It's connected to
25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial
and the coax, and on some frequencies it gave a (small)
improvement in signal strength, but it was such a pain to keep
retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to
offer the best of both worlds - improved matching between the
wire and the coax, but no retuning necessary. It's rather
expensive, though, and it may be that I'd have been just as well
off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of
tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments. No tuning knob but the slew tuning buttons work just fine. It's about the size of a paperback book and can be taken anywhere reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband

filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S iaN amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is producewhen a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the first one I had,but not as much on the seconone.The first 525 I had would "click" on strong AM signals,but the new one doesn't.The main tuning knob spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!) All in all, a great reciever.

****
Japan Radio Company NRD-535D - 1

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in

Kentucky. Universal lists the radio in their catalog for
something like $250 new if I recall correctly. You're not likely
to find it anywhere else.

When this is the case, often the best reports come from the local police, airport police, etc. They often don't encrypt, as many PD's don't have enough money to buy a scrambled radio for every officer involved in the visit.

Source record: 276643

Does anyone have experience with any of the Radio Shack
mobile scanner antennas. I've tried tieing into the car's normal
antenna, with dismal results. So now I'm looking at maybe getting
one of the units RS offers. I'm inclined towards their 'cell look-
alike' simply because I think it will be the least noticed.
(although $30.00 kinda smarts and before I spend that I want to
know it'll pull in 150MHz as well as 40.) I might consider
their 'rubber duck' extender too since I'm happy with my
pro-43's antenna performance,but that would be more hassle.

Any input welcomed.
Thanks
BB

I just bought a PRO-43 and a PRO-2006.
I have started collecting news articles from rec.radio.scanner and
alt.radio.scanner. I'm curious if anyone else collects
pertinate articles on these two scanners, and, if its not too
much trouble, could you email me your collection? I hope to get
some spare time and compile a faq on these two scanners.
thanks surreal@u.washington.edu

1488. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-03-01 20:00:54 UTC

[last changed 01-Mar-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

| INTRODUCTION

This is a list of FCC license data sources available to scanner listeners.
| The FCC master contains a wealth of data about every non-government license
| in the United States. Most of the sources below contain a subset of this
| data, although a few contain all of it. Government licenses are not
| administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. You do this at your own risk, however.

| Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on disk by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

Lee Reynolds (lee@tosspot.sv.com) has made available copies of the entire FCC master on microfiche for $75 a copy. There are three sets in all - by callsign, geographic area, and frequency - for a total of about 200 fiche. His current set is from early 1993. E-mail Lee for more information.

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

| PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are
| available by state, region, or category, and floppies are available by
| state. Also available is a CD-ROM of the entire US (2.5 million records).
| Data is updated approximately every six months.

| State floppies are $35 per state. CD-ROMs are $100 each. CD-ROM sets are
| available at a discount. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

SCANWARE ASSOCIATES

| ScanWare Associates sells a PC-based database program called the FCC
| Frequency Retrieval System V2.0. It comes with FCC data for one state,
| covering all services from 10 kHz through 2036 MHz. Data is updated
| approximately every six months (last update was Dec. 1, 1993).

| Cost is $35 for the first state and $20 for each additional state. (Add $5
| for CA, FL, TX, NY.) Discounts available for 6 or more states. Fully
| working shareware copy downloadable from their BBS at 206-871-4228
| (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice)
| or 206-698-8207 (fax).

| APPENDIX

| Here is table of data fields in the FCC master. Fields provided by various
| products are indicated by "*" or the field length, if known.

| PERCON PERCON PERCON POLICE SCAN

Question: what temp do people set the soldering iron when
desoldering the antenna and CPU shelding? I tried to keep
it around 550F, but had to increase to a little over 600F
to get things to melt.

Anyway, what it does now is display all zero whenever
I hit the enter button. It seems to still know the difference
between good frequencies, since bad ones put up "Error" instead of 000.00000.
The stored channels are all zero now as well.
Can anyone please give me a hint as to if this is a problem
in the CPU board (solder spash or something) or if it is
actually displaying the freq from the main oscillator
(that I somehow fried).
Does anyone know a good place to get one of these repaired
(out of warranty obviously)?

P.S. I did use a proper anti-static workbench and soldering iron, etc.
I would recommend others attempting this procedure to be extremely careful.
(Some of those parts are so small I am afriad I might have sucked
one into the solder-sucker without even noticing!)

Thanks for any help,
Phil Kohn

1490. Re: Hams Using Motorola Equipt?

I would be interested in any information available, not for my personal
equipment, but rather for some of the radio equipment in our ambulances.

Like the Motorola Radius we use for communicating with hospitals, etc.
Whoever programmed it included the ALS dispatch frequency, but didn't
include the CTCSS tone so its useless for communicating with ALS dispatch
or responding ALS units. Instead, when we're in the middle of a code,
ALS dispatch has to set up a patch between the HEAR frequency and ALS
dispatch, tying up two frequencies and the dispatch personnel, just so
we can communicate and coordinate with the responding mutual aid paramedics.

Or the Motorola System 9000, which has only five of its sixteen channels
programmed, and its scan bank empty.

1491. PSB ASCII VER1.0

Newsgroup: rec.radio.scanner
Date: 1994-03-01 20:40:51 UTC
From: kronz@periphae.ecn.purdue.edu
Message-ID: <CM06s3.MLI@noose.ecn.purdue.edu>
Source record: 276649

OK, People have not understood what the Postscript version of this
is...

Well To be honest that is what makes this special...The information
contained in the PSB is just a compilation of a lot of the general
freqs that have been posted here on rec.radio.scanner...

The point of PSB was to combine them into a Small Package.
The final product is a 9 page little booklet that is about
2x3 inches and is VERY Small print.. I can make a 4x5 if
people want. It would be easier to read, but would lose it's
ease of slipping into a pocket.. Thus the Pocket Scanner Book...

The Postscript version should be able to print on most laser printers...
I've printed on IBM,Apple, and HP printers....

Are you guys having problems with the compression??? If so I'll
just post the uncompressed Post Script version...

Also If there are any blaring omitions let me know I'll update it...

Here's another idea I was thinking of appending a section on Mods,
basically the main ones , the PRO series and Uniden, and whatever else
Comments??

Anyways just so you know whats in it before you go through all the
trouble of printing it, heres the ascii version...

-jason Kronz

Does this mean that the scanner will work fine with my TV antenna?

If so, those Radio Shack people sure know how to lie...

1493. Swiss Cheese Scanners

Newsgroup: rec.radio.scanner
Date: 1994-03-01 21:20:17 UTC
From: r_egeland@cc.colorado.edu
Message-ID: <2l0bii$1qt@lace.Colorado.EDU>
Source record: 276651

I'm getting really tired of this fedral hacking away at our scanners. If the Fuc-ing airwaves are public property, according to the act of 1934, the government has no authority to limit scanners in ANY way - including descrambling of coded information, etc. First the ECPA which got rid of cellular - now the FBI wants to get rid of cordless freqs on scanners!!! I think it's about time American citizens reaffirm their rights to the airwaves, before it's too late. Another thing I fear is the loss of the Amateur bands - with the new revolution in portable communications, as the RF spectrum becomes more and more valuable, I wouldn't doubt a strong corprate lobby's capability in convincing congress to just "take little nibbles" out of the Amateur bands. (After all, it's already been done several times).

As far as I'm concerned, we need to start a group ourselves for the preservation of the airwaves, although I don't exactly know how. Maybe EFF can help. Anyways, I have a scanner which recieves all frequencies from 1kHZ to about 1200Mhz, and I'll be damn'ed if I don't listen to any frequency I want, including cellular (I hope some official reads this). Furthermore, I have also decoded "private" (really public) and encrypted information (which is "illegal"). I will not hesitate to break the law when the law is corrupt. No matter how many little BS laws congress passes, I will follow the law of 1934, and listen to whatever I want, wherever I want. If people want private information, they don't shout across the town square, they send a letter. The same holds true for radio waves - if people want privacy, they can run a wires, not fill up the airwaves. Mark my words, the scanning 10 or 15 years from now will not be at all like it was ten years ago, unless we do something about it now!!!

Anyone agree?

Ryan Egeland

"Private conversations in a public place are public. Period."

This is one of the main goals of the American Radio Relay League.
(206) 666-1541 in Newington, CT.

> "illegal"). I will not hesitate to break the law when the law is corrupt. No
> matter how many little BS laws congress passes, I will follow the law of 1934,
> and listen to whatever I want, wherever I want. If people want private

I would be cautios about saying things like "I will follow the law of
1934". For better or (in this case) worse, the ECPA and so forth make
valid modifications to the law, and are legally every bit as binding
as the Communications Act.

Also, the FCC has absolute authority to pass laws governing radio. If
you disagree with their laws, either rally your local congrescritters
(that's what they get paid for), or challenge the law in court. But
simply ignoring it on idealistic principles is potentially dangerous.
>
> "Private conversations in a public place are public. Period."

True.

I once bought a cheap "Mr Microphone" style FM transmitter with the idea of feeding it audio from a scanner. I could then walk around with the scanner in a brief case or backpack (student mode) and use the walkman for listening. It seemed like an inconspicuous way to listen. Of course, it would be hard to get to the controls of the scanner. I never did use the transmitter.

Popular opinion is that the 8500 is not modifiable to restore cell freqs. Does your friend have documentation?

>that can tune the 46.xx range... I might suggest you buy those

It seems to me the FBI and FCC are trying to drive scanner manufacturers out of business by continually forcing them to redesign the circuitry. These laws aren't enforceable anyway unless you use the info in such a way that it can be proven you listened, which in itself is illegal.

1505. Source for back issues of World Scanner Report

Newsgroup: rec.radio.scanner
Date: 1994-03-02 13:26:57 UTC
From: cropley@cbnewsf.cb.att.com
Message-ID: <CM1HCx.7E7@cbfsb.cb.att.com>

Does anyone know a source for the January issue of The World Scanner Report (edited and published by Bill cheeks, I think). I went to the library and they told me that no other library in the STATE had it on file.

I read that there was an article on Pro-43 Memory expansion in 1/94 issue.

Does any one know where I could purchase a back issue or at last find one to look at??

Thanks,

Andy C
